A Audit of Congressional Record Data

We conduct an audit to check the accuracy of our algorithms for parsing the *Record* and matching speeches to speakers. We manually parse text selected by a multistage sampling procedure that chooses 2539 (319) speeches from the bound (daily) edition. The procedure randomly selects a two-year period among the first 10 (5) periods of the bound (daily) edition and randomly samples four days for inspection. It then samples four days from every subsequent tenth (fifth) period, until no more remain. On each sampled day, we select 1,000 contiguous lines of text by randomly choosing a start line and the following 999 lines of text. We require start lines to be outside the last 1,000 lines of text if there are more than 1,000 lines in a day, and we choose all the lines in a day if there are 1,000 or fewer.

We manually record each speaker’s name, chamber (including a flag for Extensions of Remarks), and whether the speaker is referred to by a title, as well as the starting and ending lines of each speech. We reduce the number of human errors in the manual parsing by double-checking the raw text whenever there is a discrepancy between our work and the automated parser and correcting any obvious errors of our own. We compare a speaker’s name between manual and automated parsings after removing all whitespace and punctuation and coercing all characters to lower case.

The automated parser recognizes the beginning of a speech in the same location as our manual parsing in 94 (99.7) percent of speeches in the respective editions. Of speeches with the same starting location not made by special speakers, the parsings agree on the exact length of a speech in 88 (77) percent of cases and differ by two lines or fewer in 94 (92) percent of cases. Speeches with the same starting location also agree on the chamber in 99 (98) percent of cases and on the speaker's name in 98 (92) percent.

Our audit of the speaker mapping covers 138 (36) speeches from the bound (daily) edition of the *Record*. The speeches are chosen by a stratified sampling procedure that randomly selects two speeches from the automated parsing at the session-edition level. We treat the two audits sequentially: conditional on the set of automatically parsed speeches from the *Record*, we measure how well our algorithm matches speeches to members of Congress.

The automated and manual mappings agree in all but three cases for the bound edition and in all cases for the daily edition. The three disagreements arose when the manual mapping was made on contextual information in the *Record* that our parsing algorithm was not designed to recognize.

B Filtering Phrases

Procedural or parliamentary language appears frequently in Congress, and may be used asymmetrically by parties (e.g., depending on whether they are in the majority or the minority). Because this language is distinct from the substantive partisanship of language we seek to identify, we filter out procedural language to the extent possible prior to our analysis.

We start our identification of procedural phrases by obtaining an electronic copy of *Robert's Rules of Order* (Robert 1876), a widely accepted manual that explains the procedures of assemblies.¹ We also obtain an electronic copy of the appendix of *Riddick's Senate Procedure* (Riddick 1992) for the 101st session (1989–1991), a glossary-style document detailing the rules, practices, and customs of the United States Senate's operations and meetings.² We consider each bigram appearing in the manuals to be procedural, calling them Robert and Riddick procedural phrases as appropriate. If a speech contains many procedural phrases, it is likely to be a procedural speech. Guided by this understanding, we identify additional procedural phrases

¹We downloaded a text version from Project Gutenberg <http://www.gutenberg.org/etext/9097> in early August 2009. It is the original 1876 version of the document.

²We downloaded a PDF version from <http://www.gpoaccess.gov/riddick/1441-1608.pdf> on August 11, 2010 and converted its contents to text using Optical Character Recognition with metadata removal.

using co-occurrence rules. First, we define a highly Robert (Riddick) speech as one for which Robert (Riddick) phrases account for at least 30 percent of all bigrams. We similarly define a procedural speech as one for which phrases appearing in either manual constitute at least 30 percent of bigrams.

We use two separate rules to identify procedural phrases not appearing in the manuals. A phrase qualifies as procedural by our first rule if one of the following sets of conditions applies:

- It appears in at least 5 procedural speeches in more than 5 sessions and one of: 1) it appears in more than 5,200 highly Robert speeches, and at least 1.75 percent of speeches it appears in are highly Robert; or 2) it appears in more than 100 highly Robert speeches, and at least 7.5 percent of speeches it appears in are highly Robert; or 3) it appears in more than 50 highly Robert speeches, and more than 30 percent of speeches it appears in are highly Robert.
- It appears in at least 5 highly Robert speeches in more than 10 sessions and one of: 1) it appears in more than 2,000 highly Robert speeches, and at least 1 percent of speeches it appears in are highly Robert; or 2) it appears in more than 100 highly Robert speeches, and at least 5 percent of speeches it appears in are highly Robert; or 3) it appears in more than 50 highly Robert speeches, and at least 20 percent of speeches it appears in are highly Robert.
- It appears in at least 5 highly Riddick speeches in more than 10 sessions and one of: 1) it appears in at least 3,000 highly Riddick speeches, and at least 1.75 percent of speeches it appears in are highly Riddick; or 2) it appears in at least 100 highly Riddick speeches, and at least 7 percent of speeches it appears in are highly Riddick; or 3) it appears in at least 50 highly Riddick speeches, and at least 20 percent of speeches it appears in are highly Riddick.

We compute, for every phrase, the average percentage of Robert's and of Riddick's procedural phrases across speeches containing the phrase. Of the phrases not identified by our first rule, a phrase qualifies as procedural by our second rule if one of the following sets of conditions applies:

- 1) It is mentioned over 500 times; and 2) it appears in more than 5 sessions; and 3) over 5 percent of bigrams in speeches in which it occurs, on average, are Robert phrases.

- 1) It is mentioned over 20,000 times; and 2) it appears in more than 10 sessions; and 3) over 7.5 percent of bigrams in speeches in which it occurs, on average, are Riddick phrases.
- 1) It is mentioned over 500 times; and 2) it appears in more than 10 sessions; and 3) over 9.6 percent of bigrams in speeches in which it occurs, on average, are Riddick phrases.

The cut-off points above are chosen to maximize the share of excluded phrases, and minimize the share of non-excluded phrases, that we judge subjectively to be procedural.

We also remove all phrases that include (i) a congressperson’s surname; (ii) the name of a state or month; (iii) numbers, or symbols; (iv) fewer than five characters, including the space; (v) a one-letter word; or (vi) any of the words from Online Appendix Table 2.

C Discussion of Partisan Phrases

Table 1 in the main paper lists the 10 most partisan phrases in every tenth session (along with the 114th session) according to our definition of phrase partisanship. Here we discuss the historical context of these phrases, and show that in each session they align closely with the policy positions and narrative strategies of the parties.

Our discussion draws mainly on the original congressional text and on the national party platforms (from Peters and Woolley 2016). We cite proceedings in Congress using the format “CR Date,” with a hyperlink to ProQuest Congressional, a gated service to which many universities subscribe.

Some phrases from the 50th session (1887-88) are discussed in the main text. In addition to those discussed there, the highly Republican phrase “sugar trust” is indicative of the Republican opposition “to all combinations of capital organized in trusts” and corresponds with the formation of the sugar trust in 1887 (Zerbe 1969).³ Controversies over the appropriation of land grants, particularly to railroad companies, are reflected in the partisanship of terms like “public domain” (Democratic) and “railroad compani” (Republican).⁴

The Republican Party platform of 1908 devotes a section to the need for “generous provision” for veterans, which is reflected in the highly Republican phrase “pay pension” in the 60th

³In CR July 9, 1888, a proposition by Nelson Dingley Jr. (R-ME) that would reduce the sugar tariff in an attempt to “strike down the sugar trusts” is debated.

⁴Both party platforms mention the issue of the public domain and decry the behavior of the other party, but only the Republican platform explicitly focuses on “railroad land grants.”

session (1907-08).⁵ The highly Republican phrase “postal save” reflects the Republican Party platform’s support for a “postal savings bank system,” while the Democratic Party platform preferred the establishment of a national “guaranteed bank” that would provide “prompt payment of the depositors of any insolvent national bank” in response to the financial panic of 1907.⁶ The Democratic Party platform of that same year has as its key theme “to free the Government from the grip of those who have made it a business asset of the favor-seeking corporations.” Several Democratic phrases of the 60th session relate to this theme, for example “bureau corpor,” a reference to the Bureau of Corporations, the predecessor to the Federal Trade Commission, and “standard oil.” The Democratic platform also emphasizes trade and shipping issues, declaring support for the Panama Canal (“canal zone,” “panama canal”), and “demanding” the repeal of tariffs on several commodities (“revis tariff”).

In the 70th session (1927-1928), both party platforms discuss flood control and waterways with the Democratic platform additionally emphasizing waterpower; this emphasis reveals itself in highly partisan, water-related phrases for both Republicans (“cove creek,” “creek dam,” “muscl shoal,” “steam plant”)⁷ and Democrats (“flowag right,” “imperi valley”).⁸ Both parties also devote attention in their platforms to the nascent radio market and associated regulation; Democratic partisan phrases like “radio commiss” and “wave length” reflect discussions about regulating this market. Both party platforms include a section on “merchant marine,” and the highly Republican phrase “american ship” reflects the passage of the Republican-supported Merchant Marine Act of 1928.⁹

Phrases from the 80th session (1947-1948) are discussed in the main text. In addition to what is mentioned there, we note that both party platforms discuss support for agriculture, reflected in phrases like “depart agricultur” (Republican). Both party platforms also mention the public debt, which aligns with the partisan phrases “nation debt” (Republican) and “budget estim” (Democratic).

In the 90th session (1967-68), Congress discussed the UN Conventions on Forced Labor

⁵CR May 12, 1908 includes an extensive amendment specifying pension benefits to accrue to individuals, for example: “The name of Annie A. Robbins, late nurse, Medical Department, United States Army, war with Spain, and pay her a pension at the rate of \$12 per month.”

⁶In CR January 6, 1909, the Senate debated a bill to “establish postal savings banks for depositing savings at interest with the security of the Government for repayment thereof.”

⁷CR May 16, 1928 contains debate on a bill “for the construction of Cove Creek Dam” and CR March 12, 1928 contains discussion of joint resolution (S.J.Res.46) “providing for the completion of Dam No. 2 and the steam plant at nitrate plant No. 2 in the vicinity of Muscle Shoals for the manufacture and distribution of fertilizer, and for other purposes.”

⁸CR May 22, 1928 includes discussion on building “a canal from the Laguna Dam to Imperial Valley.”

⁹See <http://documents.law.yale.edu/jones-white-act-see-merchant-marine-act-1928> accessed on April 18, 2017.

and the Political Rights of Women (e.g., CR February 8, 1968), both of which connect to highly Democratic terms (“human right,” “unit nation,” “men women”). The Republicans, on the other hand, are marked by support for the Human Investment Act (“invest act,” “tax credit”), which provided tax credits to employers for training and hiring certain kinds of workers. Although both parties’ 1968 platforms emphasize transportation issues, the only transportation-related phrases in the top ten partisan phrases for either party are Republican (“federalaid highway,” “highway program”). The highly Democratic phrase “gun control” reflects the passage of the Gun Control Act of 1968 and the fact that only the Democratic Party platform mentions gun control. Both party platforms mention pollution-related issues, but the only pollution-related phrase on the partisan phrase list (“air pollut”) is Democratic.

Partisan language in the 100th session (1987-88) centers around familiar Cold War themes. Both parties focus on the Iran-Contra scandal and the related conflict in Nicaragua. Democrats refer to the insurgents as “Contras” (“contra aid,” “aid contra”). Republicans instead call the insurgents “freedom fighter[s]” (e.g., CR March 17, 1988). Democrats criticize the Strategic Defense Initiative (“star war”) and have more foreign policy phrases on their list (“persian gulf,” “central american”). The Republican and Democratic phrase lists also reflect different domestic priorities. Republicans emphasize labor relations (“minimum wage”), tax policy (“tax increas”), and business conditions (“plant close”), while the Democrats focus on macroeconomic policies (“feder reserve,” “interest rate,” “presid budget”). The most Republican phrase (“judg bork”) reflects the nomination of Robert Bork to the Supreme Court by Ronald Reagan; Bork failed to be confirmed by the Senate.¹⁰ Republicans in this session are also associated with some procedural language (“demand second,” “reserv object”).¹¹

Language in the 110th (2007-2008) and 114th (2015-2016) sessions are discussed in the main text.

¹⁰See <https://constitutioncenter.org/blog/on-this-day-senate-rejects-robert-bork-for-the-supreme-court/> accessed on April 18, 2017.

¹¹For “I demand a second,” see CR October 3, 1988. For “I withdraw my reservation of objection,” see CR October 21, 1988.

D Data for Extension to Residential Segregation

D.1 Party Identification

For party identification from 1958 to 1998, we use the American National Election Studies (ANES) Time Series Cumulative Data File 1948–2012. ANES surveys are conducted every two years since 1956. We keep surveys from years 1958 to 1998, omitting 1962 since the survey in this year does not include county identifiers. Most ANES surveys use face-to-face interviews, with the households chosen using stratified cluster sampling at successively smaller geographies.¹² Our final estimation sample from the ANES consists of 32,604 observations, ranging from 1,020 to 2,282 observations per year.

For party identification from 2000 to 2009, we combine the 156 surveys from the Pew Research Center listed in Online Appendix Table 5. These surveys focus on many different topics. Most Pew surveys draw nationally representative probability samples of adults living in the United States with a telephone in their household. The estimation sample consists of 225,157 observations, ranging from 10,014 to 32,700 observations each year.

Both sources ask respondents if they identify with either of the two major parties, and if they do not, whether they “lean” toward one over the other.¹³ We assign leaners to their respective party. We drop all respondents who do not claim any party leaning as well as one observation with a missing value for gender. We do not use sample weights on observations from either data source.

D.2 Campaign Contributions

We use public Federal Elections Commission (FEC) data on contributions published on even years from 1980 to 2014. The FEC releases data on individual contributions above a certain threshold (500 dollars before 1988 and 200 dollars onwards) to political action committees (PACs). All contributors are required to provide their addresses, which the FEC abstracts to

¹²For more information, see DeBell (2010).

¹³For example, the ANES consistently asks “Generally speaking, do you usually think of yourself as a Republican, a Democrat, an Independent, or what?” If the response is “Independent” or other, the survey follows up with “Do you think of yourself as closer to the Republican or Democratic party?” The Pew late-October 2008 Political Survey asks “In politics TODAY, do you consider yourself a Republican, Democrat, or independent?” If the response is “independent” or other, the survey follows up with “As of today do you lean more to the Republican Party or more to the Democratic Party?” [original emphasis] Question wording has not stayed constant across years, but all ANES surveys and most Pew surveys include two party identification variables in the nested structure described above. The remaining Pew surveys contain at least one question on party identification.

the zipcode-level before publication. The Federal Election Campaign Act of 1971 mandates the release of these data on individuals. Online Appendix Table 6 provides the complete list of transaction codes included in our sample. Starting from 2004, the data contain an indicator for whether a contributor is an individual. We drop all contributors identifying as a non-individual (e.g. organization, candidate, PAC, etc.). These dropped observations make up an average of 0.5% of the original data for each of those years.

We consider an individual as a contributor to a party if the majority of her contribution amount is toward PACs affiliated with that party. Our final estimation sample consists of 4,530,875 Republican and 3,742,850 Democratic unique names.

Notes: Table shows data from the bound and daily editions of the *Congressional Record*. We show for each session the number of unique speakers, the number of unique phrases, and the the total phrase counts for Democratic and Republican speakers used in the estimation sample. We also show for each session the number of speeches that we identify in the *Record* and flag neither as appearing in the Extensions of Remarks nor as being delivered by speakers identified by office rather than name (e.g., “The Clerk”), the number of these speeches that we match to members of Congress, and the match rate of these speeches to members of Congress.

Online Appendix Table 2: Manually Selected Words Used to Exclude Phrases as Procedural

absent	adjourn	ask	can	chairman
committee	con	democrat	etc	gentleladies
gentlelady	gentleman	gentlemen	gentlewoman	gentlewomen
hereabout	hereafter	hereat	hereby	herein
hereinafter	hereinbefore	hereinto	hereof	hereon
hereto	heretofore	hereunder	hereunto	hereupon
herewith	month	mr	mrs	nai
nay	none	now	part	per
pro	republican	say	senator	shall
sir	speak	speaker	tell	thank
thereabout	thereafter	thereagainst	thereat	therebefore
therebeforn	thereby	therefor	therefore	therefrom
therein	thereinafter	thereof	thereon	thereto
theretofore	thereunder	thereunto	thereupon	therewith
therewithal	today	whereabouts	whereafter	whereas
whereat	whereby	wherefore	wherefrom	wherein
whereinto	whereof	whereon	whereto	whereunder
whereupon	wherever	wherewith	wherewithal	will
yea	yes	yield		

Notes: Table presents words we use to identify phrases for removal. Any phrase containing the stem of at least one of these words is removed from our final vocabulary.

Online Appendix Table 3: Details on Topic Classification

Topic	Threshold	Keywords	Phrases in topic	Phrases excluded as false matches
alcohol	50	antisaloon, distil, alcohol, liquor, spirit, malt, saloon	alcohol beverag, alcohol content, alcohol tobacco, drug alcohol, abus alcohol, bureau alcohol, ceat alcohol, alcohol drug, intox liquor, antisaloon leagu (17)	letter spirit, bipartisan spirit, spirit constitut, spirit compromis, spirit bipartisanhip, public spirit, spirit freedom, american spirit, human spirit, spiritu leader (13)
budget	125	budget, debt, defici, expenditur, spend, balanc, treasuri, expens, revenu	budget reconcili, budget plan, level spend, unifi budget, spend limit, rais debt, reduc spend, loss revenu, support budget, spend less (204)	tax expenditur, famili budget, revenu increas, balanc need, billion revenu, vote balanc, unexpend balanc, continu spend, unoblig balanc, reserv balanc (34)
business	75	bankruptci, agricultur, coal, owner, capit, stock, commod, canal, oil, credit, electr, farm, loan, financ, leather, railroad, patent, plant, potato, privat, wool, refin, sugar, salt, textil, profit, enterpri, commerc, fishermen, busi, petroleum, industri, chief execut, compani, gas, banker, manufactur, mine	gas pump, credit countri, interst commerc, build canal, american farmer, loan author, agricultur commod, insur loan, timber industri, farmer want (891)	american soil, capitol build, like mine, financi assist, privat concern, provid financi, presid nomine, financi aid, privat social, home ownership (85)
crime	50	crime, traffick, opium, rehabilit, crim, drug, gun, narcot, shoot, sentenc, prison	state crimin, drug countri, violent crimin, heinous crime, increas drug, drug import, drug war, crime occur, drug one, crimin enterpris (211)	institut drug, prison popul, racial discrimin, anim drug, state prison, problem drug, one sentenc, prohibit discrimin, discrimin duti, bureau prison (65)
defense	75	arm, navi, armi, atom, defens, war, guard, missil, homeland, fighter, naval, navyyard, soldier, prison, veteran, intellig, enlist, bomb, weapon, combat, militari, torpedo	weapon capabl, privat soldier, intellig oper, warsaw pact, war think, intellig surveil, armi corp, war labor, veteran educ, honor veteran (584)	freight forward, individu farmer, farm subsidi, support farm, warn us, farmer produc, famili farmer, releas prison, put forward, farmer rancher (252)
economy	50	growth, recoveri, econom, unemploy, poverti, stimulus	economi job, longterm unemploy, economi area, econom disloc, recoveri program, assist econom, econom life, economi put, make economi, econom success (424)	conserv recoveri, growth countri, growth defens, growth develop, growth feder, growth govern, growth polici, old growth, percent growth, popul growth (10)
education	50	campus, educ, school, lunch, student, teacher, academ	student faculti, educ unit, american school, import educ, school dropout, educ relat, build school, school superintend, econom educ, lowincom student (477)	reduc deficit, reduc feder, debt reduct, reduc nuclear, actual reduc, reduc paperwork, reduc time, reduc oil, go reduct, state reduct (219)
elections	50	campaign, elect, vote, ballot	local elect, vote poll, secret ballot, influenc elect, bipartisan vote, vote reduct, vote precinct, popular elect, vote feder, vote unit (201)	educ campaign, electron equip, state elect, electr generat, media campaign, vote tariff, electr co, time elect, vote dont, director select (56)
environment	50	pollut, garden, climat, dam, forest, wast, hurrican, natur, plant, conserv, eros, contam, soil, canyon, environ, shale, lake	understand natur, environment assess, natur thing, mother natur, environment degrad, lowlevel wast, develop environment, dam across, wast dump, dam reservoir (192)	reserv forc, militari reserv, conserv liber, strateg reserv, war plant, repair damag, grain reserv, indian reserv, immigr natur, damag economi (183)
federalism	125	regul, state, southern, local, union, agenc, confeder, secede, execut, feder, interst	state air, appropri state, agenc must, feder respons, feder constitut, feder deficit, state plan, state line, feder effort, local offic (538)	farmer union, japanes govern, percent state, particular state, arab state, unit statessoviet, chief execut, trade union, german govern, accord statement (66)
foreign	125	duti, qaeda, canada, chines, china, aid, salvador, foreign, britain, persia, philipin, porto, puerto, saddam hussein, spanishamerican, communism, troop, cold war, latin, khmer, independ, postcold war, spanish, german, spain, iran, asia, bolivia, vietnam, afghanistan, treati, communist, contra, cuba, genocid, haiti, iraq, mexic, nicaragua, panama, soviet, kingdom	vietnam era, foreign languag, depend foreign, state soviet, asian develop, foreign aid, chines communist, veteran foreign, mexican govern, freedom independ (184)	said look, year said, direct toward, defens budget, economi nation, nation labor, medicar medicaid, nation academi, repeat said, balanc budget (368)

Details on Topic Classification (*continued*)

Topic	Threshold	Keywords	Phrases in topic	Phrases excluded as false matches
government	75	govern, depart, highway, ineitem, medicaid, regulatori, medicar, stimulus, welfar, privati, benefit, bureau, municip, agenc	manag agenc, welfar payment, industri govern, right govern, govern creat, author govern, concern welfar, govern also, spend govern, state highway (697)	benefit colleagu, oper depart, guarante benefit, survivor benefit, go benefit, percent benefit, direct benefit, econom benefit, iraqi govern, benefit packag (101)
health	50	care, care reform, health, medicar, mental, nurs, coverag, nutrit, hiv, hospit, medicaid, gyn, medic, cell	use medic, overal health, militari health, care studi, insur coverag, includ health, prevent health, health care, primari care, bill medicar (603)	cell phone, public career, year career, profession career, care unemploy, term care, care also, examin care, care much, like health (100)
immigration	50	alien, illeg, immigr, foreign, citizen, undoc, border, detain	foreign born, legal illeg, countri illeg, involv foreign, nation border, come foreign, allow foreign, subcommitte immigr, side border, reform immigr (80)	vulner citizen, concern citizen, foreign mail, depend foreign, issu foreign, patriot citizen, foreign countri, citizen whose, competit foreign, paid foreign (230)
justice	50	court, justic, freedman, right, trial, lawyer, habea, attorney, clerk, judici	right particip, right front, justic burger, justic scienc, right record, preserv right, provid court, right selfdefens, court order, tri right (485)	left right, clinic trial, right away, go right, thing right, done right, right approach, way right, right answer, given right (38)
labor	75	compens, worker, employ, salari, job, longshoremen, labor, pension, pay, unemploy, vocat, wage, strike, retir, union	labor practic, cheap labor, reduc salari, job peopl, lost job, employe govern, provid job, postal worker, rise unemploy, govern employ (624)	depart commerc, pay offic, program payment, payment lieu, intern union, expens taxpay, commerc depart, cash payment, billion taxpay, requir pay (179)
mail	50	mail, freedeliveri, posta, postoffic, messeng, postmast	mail pay, rate postag, receiv mail, postal receipt, postal system, ocean mail, deliv mail, mail rate, postal card, postmast general (61)	n/a
minorities	50	african, choctaw, color, jew, equal, hate, right, women, philippin, negro, discrimin, woman, segreg, right act, filipino, muslim, hawaian, cherokee, indian, tribe, tribal	women voter, bureau indian, indian agent, leagu women, ensur women, indian educ, tribal govern, elimin discrimin, women militari, indian communiti (230)	upon right, bargain right, right justic, right measur, right fix, system right, right talk, right concern, right away, right just (371)
money	50	dollar, treasuri, gold, silver, tender, coin, payment, note, cash, monet	dollar valu, dollar limit, payabl coin, secretari treasuri, tender payment, dollar just, coinag silver, silver gold, cash payment, treasuri bill (178)	import note, presid note, one dollar, goldman sach, payment lieu, payment limit, payment adjust, payment hospit, disabl payment, pay silver (144)
religion	50	islam, religi, prayer, jew, mormon, jehovah, muslim, buddhi, christian, cathol, hindu, protest, judai, sectarian	american jewish, religi leader, exercis religion, million jew, religi belief, religion sex, christian scienc, roman cathol, soviet jewish, prayer school (47)	administr depart, administr cost, state administr, administr veteran, administr develop, administr polici, electrif administr, administr nation, within administr, enter protest (290)

Notes: Calculations are based on our preferred specification in panel A of figure 3. The table shows the Republican and Democratic phrases with the greatest magnitude of estimated partisanship ζ_{jt} alongside the predicted number of occurrences of each phrase per 100,000 phrases spoken by Republicans or Democrats. Phrases with positive values of ζ_{jt} are listed Republican and those with negative values are listed as Democratic. Please see the body of the paper for the definition of partisanship ζ_{jt} .

Online Appendix Table 6: FEC Transaction Codes Included in Estimation Sample

Transaction type	Description
10	Contribution to Independent Expenditure-Only Committees (Super PACs), Political Committees with non-contribution accounts (Hybrid PACs) and nonfederal party “soft money” accounts (1991-2002) from a person (individual, partnership, limited liability company, corporation, labor organization, or any other organization or group of persons)
15	Contribution to political committees (other than Super PACs and Hybrid PACs) from an individual, partnership or limited liability company
15E	Earmarked contributions to political committees (other than Super PACs and Hybrid PACs) from an individual, partnership or limited liability company
15F	Loans forgiven by candidate
15Z	In-kind contribution received from registered filer

Notes: Description of transaction types is provided by the FEC at <http://www.fec.gov/finance/disclosure/metadata/DataDictionaryTransactionTypeCodes.shtml> as of May 13, 2013.

Online Appendix Figure 1: Average Partisanship of Speech Estimated on Alternative Samples

Notes: “Real” series is from actual data; “random” series is from hypothetical data in which each speaker’s party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active. Panel A’s specification restricts the sample for estimation to speaker-sessions observed in the House, whereas Panel B’s applies the same restriction for speaker-sessions observed in the Senate. Panel C’s specification excludes speakers representing states in the South census region from estimation. Last, Panel D’s specification decreases the number of phrases used in estimation by roughly 10 percent. We implement this restriction by requiring that phrases in our vocabulary are spoken at least 11 times in at least one session, at least 110 times across all sessions, and in at least 11 speaker sessions. (We use the minimums of 10, 100, and 10 to produce the baseline specification’s vocabulary.) We alter our covariate design when estimating partisanship using an alternative sample, omitting covariates corresponding to features universally possessed or lacked by speaker-sessions in this sample.

Online Appendix Figure 2: Average Partisanship of Speech, Alternative Data Build

Notes: “Real” series is from actual data; “random” series is from hypothetical data in which each speaker’s party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active. This specification uses data from the *Congressional Record* bound edition for sessions 43-96 and from its daily edition for sessions 97-114 and the same vocabulary as our baseline estimates.

Online Appendix Figure 3: Average Verbosity per Speaker-Session

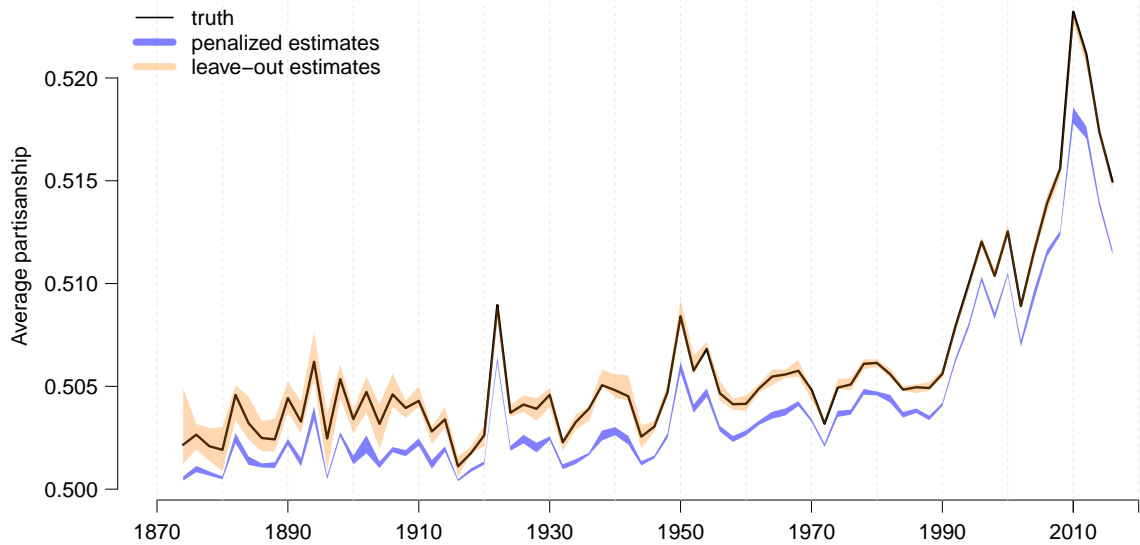

Notes: Plot shows, separately for each chamber and session, the average number of phrase (bigram) utterances across speakers in our estimation sample before making any vocabulary restrictions.

Online Appendix Figure 4: Parametric Bootstrap of Leave-out and Penalized Estimators

Panel A: Baseline Specification

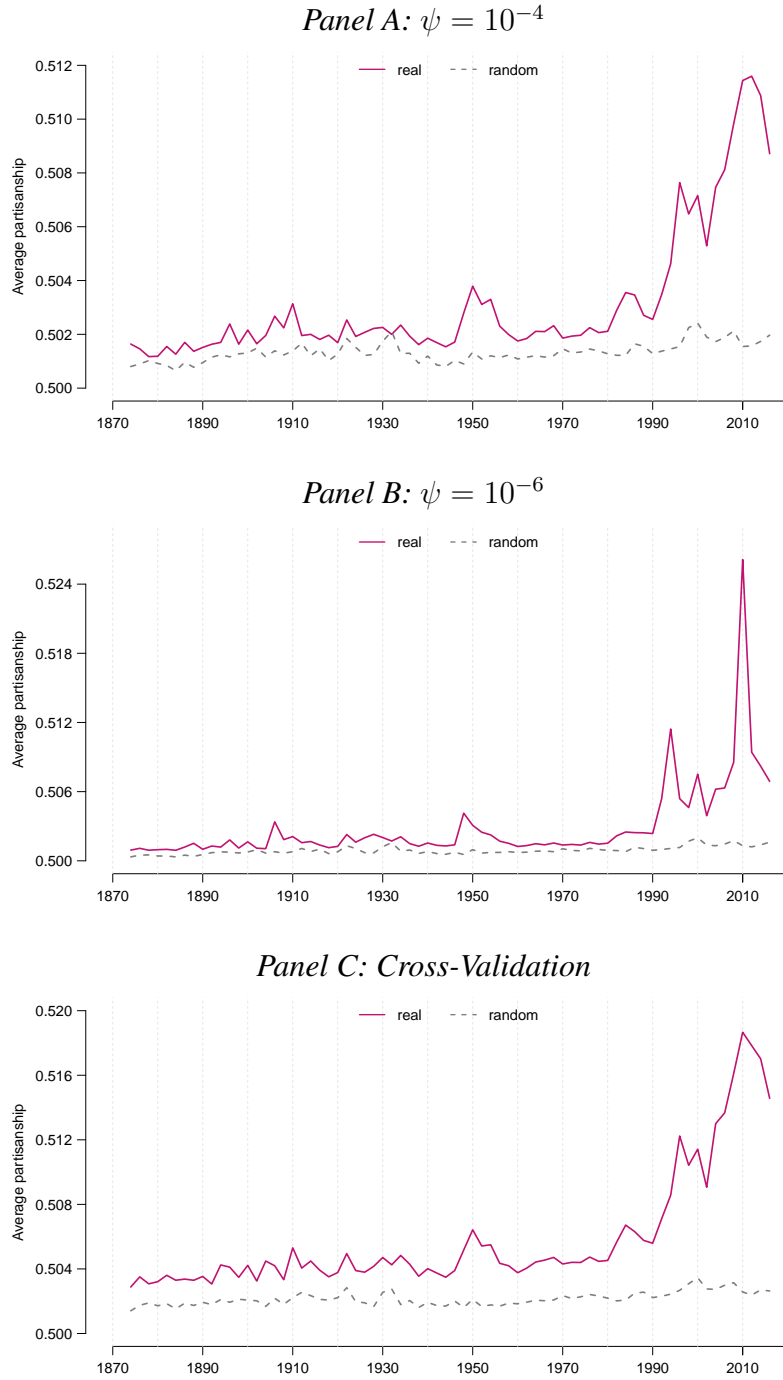

Panel B: No Covariates Specification

Notes: Figure shows parametric bootstrap results for leave-out and penalized estimates of average partisanship $\bar{\pi}_t$. We restrict attention to the data from the most frequently spoken 1,000 phrases for computational reasons. We begin by computing our penalized estimates on the restricted data. We produce 10 bootstrap replicates by generating data for all speaker-sessions using the estimated model. We then use the 10 generated datasets to compute the leave-out estimate and our preferred penalized estimate of average partisanship. Each panel shows the 10th–90th percentile range of the replicates for each of the estimates. Panel A shows results where the true series is based on our preferred specification with covariates. Panel B shows results where the true series is based on our preferred specification without covariates.

Online Appendix Figure 5: Average Partisanship of Speech Using Alternative Estimation Settings

Notes: “Real” series is from actual data; “random” series is from hypothetical data in which each speaker’s party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active. Panels A’s and B’s specifications change the fixed cost penalty ψ to the values indicated by their titles. Panel C’s specification is identical to our preferred specification except that we use 5-fold cross-validation to select the λ_j that minimizes average out-of-sample deviance for each phrase j .

Online Appendix Figure 6: Average Partisanship of Speech, Five Subsamples

Notes: Plot shows the results from our preferred penalized estimator defined in the main paper. “Real” series is from actual data; “random” series is from hypothetical data in which each speaker’s party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active. The shaded region around each series represents a pointwise confidence interval obtained by subsampling (Politis et al. 1999). Specifically, we randomly partition the set of speakers into 5 equal-sized subsamples (up to integer restrictions) and, for each subsample k , we compute the penalized estimate $\hat{\pi}_t^k$. Define $Q_t^k = \sqrt{\tau_k} \left(\log(\hat{\pi}_t^k - \frac{1}{2}) - \log(\frac{1}{5} \sum_{l=1}^5 \hat{\pi}_t^l - \frac{1}{2}) \right)$ where τ_k is the number of speakers in the k th subsample. Our confidence interval is $\frac{1}{2} + (\exp[\log(\hat{\pi}_t - \frac{1}{2}) - (Q_t^k)_{(5)}/\sqrt{\tau}], \exp[\log(\hat{\pi}_t - \frac{1}{2}) - (Q_t^k)_{(1)}/\sqrt{\tau}])$ where $\tau = |R_i \cup D_i|$ is the number of speakers in the full sample and $(Q_t^k)_{(b)}$ is the b th order statistic of Q_t^k .

Online Appendix Figure 7: Average Partisanship of Speech, Bias-Corrected Penalized Estimates

Notes: Plot shows the results from our preferred penalized estimator defined in the main paper. “Real” series is from actual data; “random” series is from hypothetical data in which each speaker’s party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active. The shaded region corresponding to each series represents a bias-corrected pointwise confidence interval obtained by subsampling (Politis et al. 1999). Specifically, we randomly partition the set of speakers into 10 equal-sized subsamples (up to integer restrictions) and, for each subsample k , we compute the penalized estimate $\hat{\pi}_t^k$. Define $Q_t^k = \sqrt{\tau_k} (\log(\hat{\pi}_t^k - \frac{1}{2}) - \log(\hat{\pi}_t - \frac{1}{2}))$ where τ_k is the number of speakers in the k th subsample. Our confidence interval is $\frac{1}{2} + (\exp[\log(\hat{\pi}_t - \frac{1}{2}) - (Q_t^k)_{(9)}/\sqrt{\tau}], \exp[\log(\hat{\pi}_t - \frac{1}{2}) - (Q_t^k)_{(2)}/\sqrt{\tau}])$ where $\tau = |R_i \cup D_i|$ is the number of speakers in the full sample and $(Q_t^k)_{(b)}$ is the b th order statistic of Q_t^k .

Online Appendix Figure 8: Approximate Bias in Maximum Likelihood Estimate of Partisanship

Notes: Plot shows the approximate bias in $\hat{\pi}_t^{MLE}$ when covariates do not matter ($\mathbf{x}_{it} := \mathbf{x}_t$) and true partisanship is $\frac{1}{2} (\mathbf{q}_t^R(\mathbf{x}) = \mathbf{q}_t^D(\mathbf{x}))$. We can rewrite $\hat{\pi}_t^{MLE}$ as

$$\hat{\pi}_t^{MLE} = \frac{1}{2} \sum_{j \in J_t} \frac{(\hat{q}_{jt}^R)^2 + (\hat{q}_{jt}^D)^2}{\hat{q}_{jt}^R + \hat{q}_{jt}^D}, \quad (1)$$

where J_t is the set of unique phrases spoken in session t . To approximate the bias in $\hat{\pi}_t^{MLE}$, let $c_{jt}^R = \sum_{i \in R_t} c_{ijt}$, $c_{jt}^D = \sum_{i \in D_t} c_{ijt}$ and suppose that $c_{jt}^R \sim \text{Pois}(\eta_{jt}^R)$ and $c_{jt}^D \sim \text{Pois}(\eta_{jt}^D)$. Each summand in equation (1) is independent. Taking the expectation of a first-order Taylor expansion of (1) around its true value gives

$$\mathbb{E}(\hat{\pi}_t^{MLE}) \approx \frac{1}{2} \sum_{j \in J_t} \frac{(\eta_{jt}^R + (\eta_{jt}^R)^2) / (m_t^R)^2 + (\eta_{jt}^D + (\eta_{jt}^D)^2) / (m_t^R)^2}{\eta_{jt}^R / m_t^R + \eta_{jt}^D / m_t^D},$$

where here we treat $m_t^R = \sum_j c_{jt}^R$ and $m_t^D = \sum_j c_{jt}^D$ as fixed and known. Imposing that $\eta_{jt}^R = \eta_{jt}^D$ for all j , we have that

$$\mathbb{E}(\hat{\pi}_t^{MLE}) - \frac{1}{2} \approx \frac{|J_t|}{4} \left(\frac{m_t^R + m_t^D}{m_t^R m_t^D} \right), \quad (2)$$

where the term on the right-hand side of (2) is the approximate bias plotted above.

Online Appendix Figure 9: Isolating Changes in Maximum Likelihood Estimate Due to Changes in Verbosity

Notes: The series labeled “observed” is the observed value of $\hat{\pi}^{MLE}$. The series labeled “verbosity only” is the value of $\hat{\pi}^{MLE}$ on phrase count data sampled from the distribution $MN(m_{it}, \hat{\mathbf{q}}_{t^*}^{P(i)})$ where t^* is the 103rd session. Therefore, in the “verbosity only” series, verbosity follows its empirical distribution but phrase frequencies are held constant at their empirical values for the 103rd session.

Online Appendix Figure 10: Maximum Likelihood Estimates with Frequently Occurring Phrases

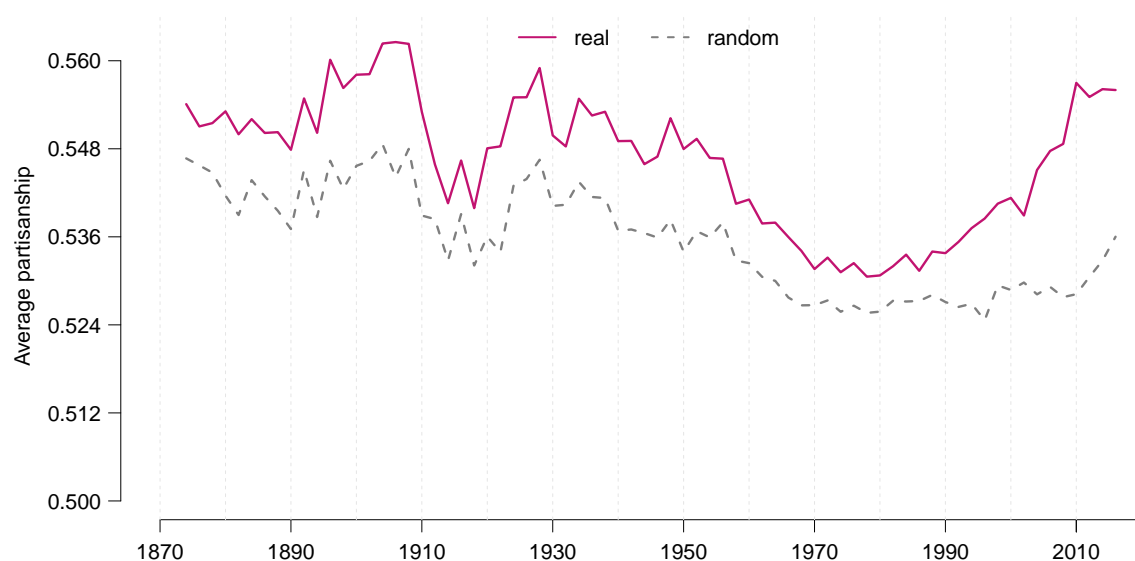

Notes: Each plot shows $\hat{\pi}_t^{MLE}$ computed on the most frequently occurring phrases. Specifically, let $m_{jt} = \sum_i c_{ijt}$. The plots on the left show $\hat{\pi}_t^{MLE}$ computed on the set of phrases with $m_{jt} > g_t$ where g_t is chosen to be the $(1 - p)$ th quantile of m_{jt} across all phrases j in a given session t , for each $p \in \{0.90, 0.50, 0.10, 0.01\}$. The plots on the right show $\hat{\pi}_t^{MLE}$ computed on the set of phrases with $m_{jt} > g$ for $g \in \{5, 20, 100, 500\}$. “Real” series is from actual data; “random” series is from hypothetical data in which each speaker’s party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active.

Online Appendix Figure 11: Maximum Likelihood Estimate from Data in Jensen et al. (2012)

Notes: Figure reports $\hat{\pi}^{MLE}$ computed using replication data for Jensen et al. (2012). “Real” series is from actual data; “random” series is from hypothetical data in which each speaker’s party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active.

Online Appendix Figure 12: Average Partisanship of Speech, Minimal Penalty ($\lambda \approx 0$)

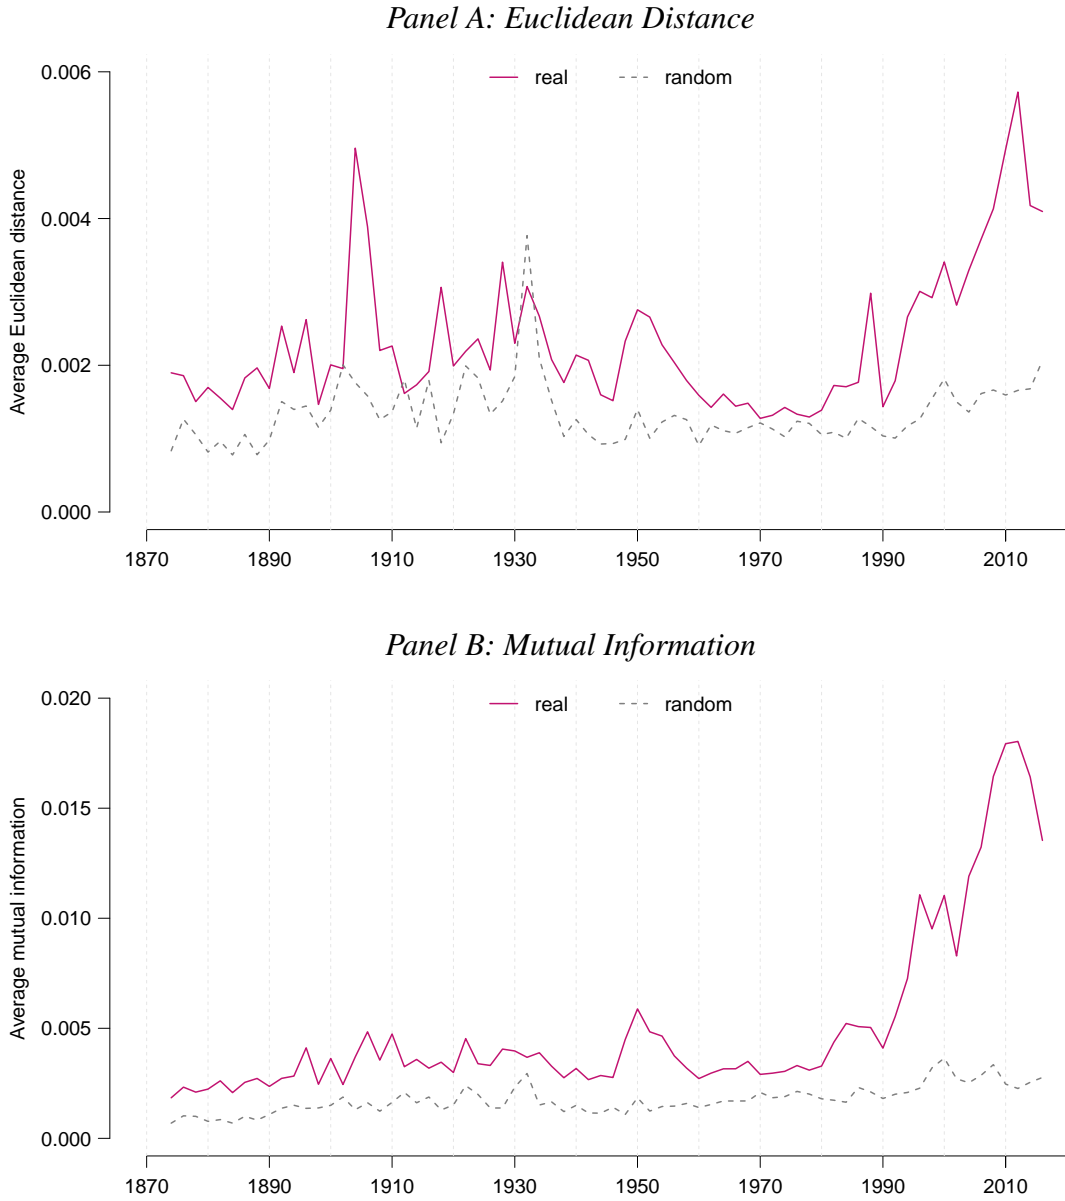

Notes: Plot shows estimated average partisanship when we modify our preferred penalized estimator to set λ_j for all j equal to its final value λ_j^G in the regularization path, which is approximately zero. “Real” series is from actual data; “random” series is from hypothetical data in which each speaker’s party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active.

Online Appendix Figure 13: Isolating Changes in Penalized Estimates Due to Changes in Verbosity

Notes: Figure shows results from our preferred penalized estimator defined in the main paper. “Simulated” series is from simulated data, where phrase counts are sampled from the distribution $MN(m_{it}, \hat{\mathbf{q}}_{t^*}^{P(i)})$ where t^* is the 103rd session; “random simulated” series is from a version of the simulated data, in which each speaker’s party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active.

Online Appendix Figure 14: Different Target Measures of Speech Polarization

Notes: “Real” series is from actual data; “random” series is from hypothetical data in which each speaker’s party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active. Panel A reports the average of Euclidean distance between $\mathbf{q}_t^R(\mathbf{x}_{it})$ and $\mathbf{q}_t^D(\mathbf{x}_{it})$ across speakers in session t for each session in our sample, defined as $\frac{1}{|R_t \cup D_t|} \sum_{i \in R_t \cup D_t} \sqrt{\sum_{j \in J} (q_{jt}^R(\mathbf{x}_{it}) - q_{jt}^D(\mathbf{x}_{it}))^2}$. Panel B reports average mutual information between party and phrase choice, given a neutral prior. This is defined as $\frac{1}{|R_t \cup D_t|} \sum_{i \in R_t \cup D_t} I(\mathbf{x}_{it})$ where $I(\mathbf{x}_{it}) = 1 - \sum_j \frac{q_{jt}^R(\mathbf{x}_{it})}{2} \log_2\left(\frac{1}{\rho_{jt}(\mathbf{x}_{it})}\right) + \frac{q_{jt}^D(\mathbf{x}_{it})}{2} \log_2\left(\frac{1}{1 - \rho_{jt}(\mathbf{x}_{it})}\right)$. In all cases estimates are from our preferred specification.

Online Appendix Figure 15: Average Partisanship of Speech with Different Covariate Designs

Panel A: No Covariates

Panel B: Speaker Effects

Panel C: Additional Covariates

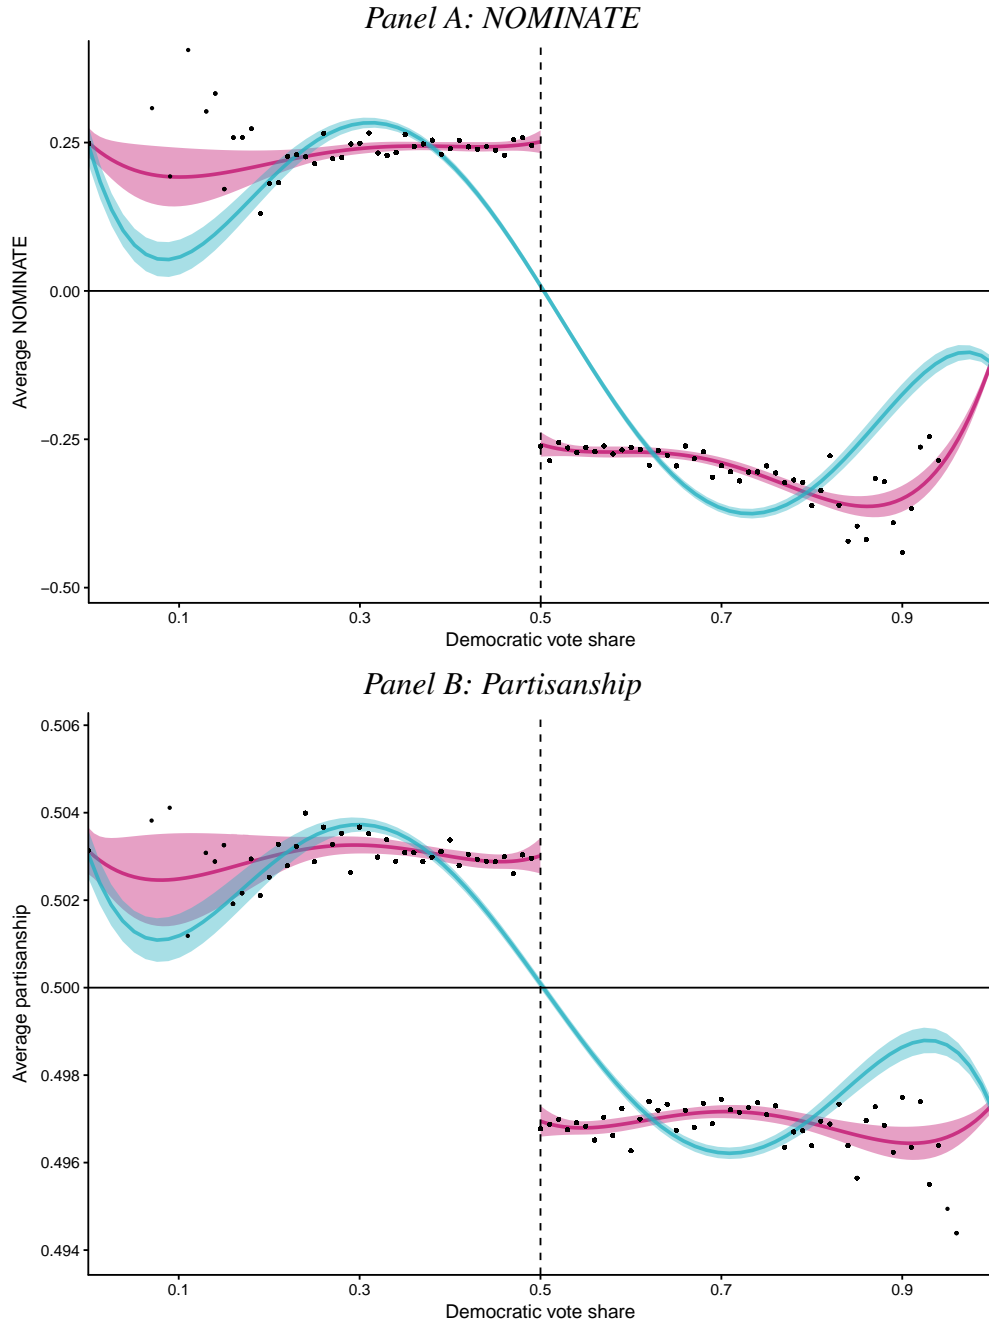

Notes: “Real” series is from actual data; “random” series is from hypothetical data in which each speaker’s party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active. Panel A’s specification imposes that $\tilde{\gamma}_{jt} = 0$. Panel B’s specification includes in \mathbf{x}_{jt} a speaker random effect v_{ijt} that is independent of covariates and is distributed as $Laplace(0, \kappa)$ so that its standard deviation is $\sqrt{2}/\kappa$. We set $\hat{\kappa} = \sqrt{2}/sd(\hat{e}_{ijt})$ where $\hat{e}_{ijt} = \log(c_{ijt}/\exp[\hat{\mu}_i + u_{ijt}])$ are the observed Poisson residuals from our baseline model when $c_{ijt} > 0$. We then estimate the random effects v_{ijt} and the remaining parameters of the model by exploiting the fact that posterior maximization under the Laplace assumption is equivalent to L_1 -penalized deviance minimization with cost κ/n , where n is the number of speaker-sessions (see, e.g., Taddy 2016). We impose a minimal penalty of $\psi = 4 \times 10^{-5}$ on the speaker random effects v_{ijt} and choose $\hat{\lambda}_j^G$ with $\iota = 10^{-3}$. Panel C’s specification includes indicators for family members in Congress, having attended college, military service, prior public service, being a lawyer, and whether any of the aforementioned variables are missing.

Online Appendix Figure 16: Average Partisanship of Speech Estimated on Alternative Time Frames

Notes: For each group of speaker-sessions, the solid line shows estimated average partisanship for the real data. The corresponding dashed line shows estimated average partisanship for hypothetical data in which each speaker's party is randomly assigned with the probability that the speaker is Republican equal to the average share of speakers who are Republican in the sessions in which the speaker is active. Each specification restricts the sample for estimation to sessions starting after the year indicated by the legend.

Online Appendix Figure 17: Discontinuity in Democratic Vote Share from Lee et al. (2004)

Notes: Panel A follows the first panel of Figure VI from Lee et al. (2004). It plots the non-Common-Space DW-NOMINATE scores (Carroll et al. 2015b) for the House representatives in a session against the Democratic vote shares in the corresponding elections. Panel B reproduces Panel A but plots each representative's posterior probability $\hat{\rho}_{it}$ of being Republican based on speech on the vertical axis. As in Panel B of Figure 5, we define $\hat{\rho}_{it} = \hat{\mathbf{q}}_{it} \cdot \hat{\boldsymbol{\rho}}_t^*(\mathbf{x}_{it})$, where we recall that $\hat{\mathbf{q}}_{it} = \mathbf{c}_{it}/m_{it}$ are the empirical phrase frequencies for speaker i in session t and where we define $\hat{\boldsymbol{\rho}}_t^*(\mathbf{x}_{it})$ as the estimated value of $\boldsymbol{\rho}_t(\mathbf{x}_{it})$ from our baseline penalized estimates. Both panels are restricted to representatives in our main speech sample who serve between 1946 and 1992, have a non-missing DW-NOMINATE score in session t , and which we are able to match to election outcomes (King 1995). As in Lee et al. (2004), each dot is the average of the variable on the vertical axis within 0.01 bins of Democratic vote share. Fourth-order polynomials and their associated 95 percent pointwise confidence intervals are separately fit on either side of the discontinuity at 0.5. A fifth-order polynomial and its associated 95 percent pointwise confidence interval is fit over the entire sample. The horizontal line marks the neutral value of the variable on the vertical axis.

Online Appendix Figure 18: Average Partisanship of Speech between and within Parties

Notes: Figure provides our preferred estimate of average partisanship and our estimate of “within-party partisanship.” In producing the latter, we define the set of extreme congresspeople in session t , denoted by E_t , as the set containing each speaker in session t with a first-dimension Common Space DW-NOMINATE score from Carroll et al. (2015a) that is more extreme than the median score of that speaker’s party in session t ; we define the moderates M_t as the set of all other speaker-sessions in t . We estimate within-party partisanship using estimated coefficients from the adjusted model:

$$u_{ijt} = \tilde{\alpha}_{jt} + \mathbf{x}_{it}' \tilde{\gamma}_{jt} + \tilde{\varphi}_{jt}^{RE} \mathbf{1}_{i \in R_t \cap E_t} + \tilde{\varphi}_{jt}^{RM} \mathbf{1}_{i \in R_t \cap M_t} + \tilde{\varphi}_{jt}^{DE} \mathbf{1}_{i \in D_t \cap E_t} + \tilde{\varphi}_{jt}^{DM} \mathbf{1}_{i \in D_t \cap M_t}.$$

where $\tilde{\varphi}_{jt}^{RE}$, $\tilde{\varphi}_{jt}^{RM}$, $\tilde{\varphi}_{jt}^{DE}$, and $\tilde{\varphi}_{jt}^{DM}$ are phrase-time-specific group loadings. Here, the groups are given by the two-way interaction of E_t and R_t in the natural way. We estimate the model’s coefficients using our baseline penalized estimator and use the results to compute our phrase-frequency vector estimates $\hat{\mathbf{q}}_t^{RE}(\mathbf{x}_{it})$, $\hat{\mathbf{q}}_t^{RM}(\mathbf{x}_{it})$, $\hat{\mathbf{q}}_t^{DE}(\mathbf{x}_{it})$, and $\hat{\mathbf{q}}_t^{DM}(\mathbf{x}_{it})$. We use these, in turn, to estimate in-party analogues of $\rho_t(\mathbf{x}_{it})$. For each Republican $i \in R_t$, for instance, we compute

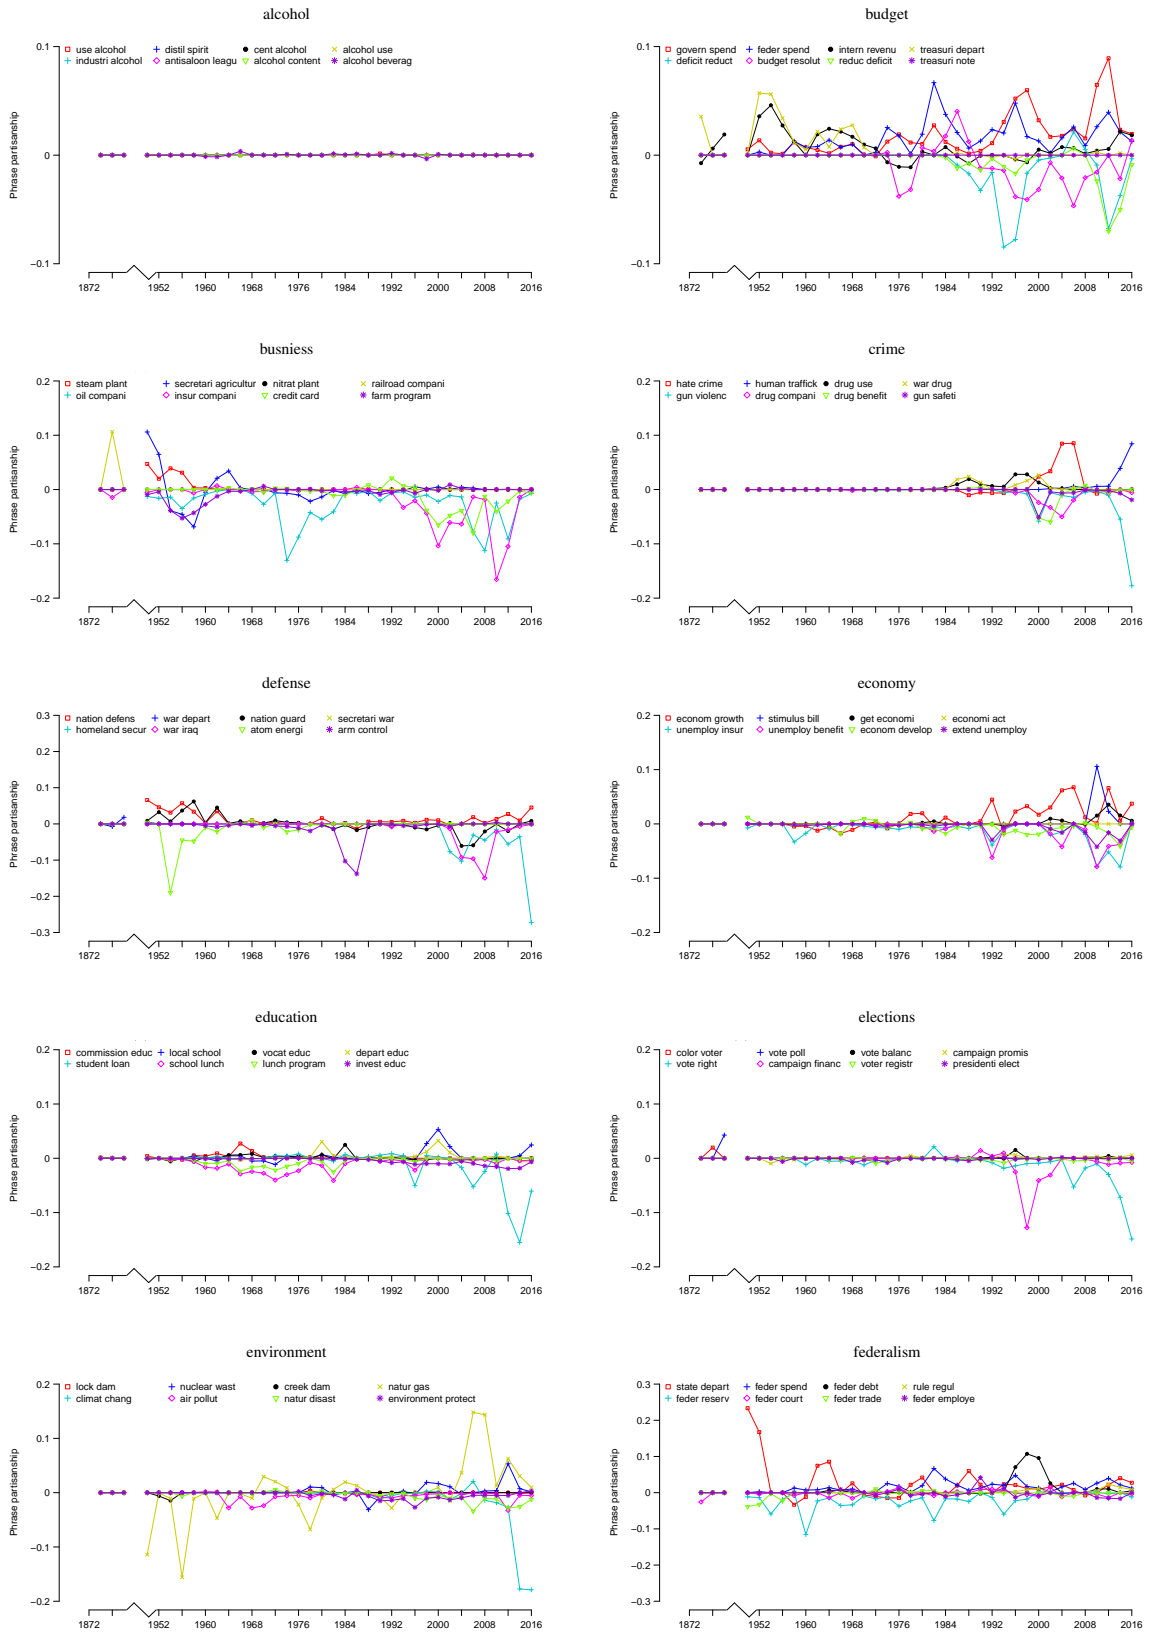

$$\hat{\rho}_{jt}^R(\mathbf{x}_{it}) = \frac{\hat{q}_{jt}^{RE}(\mathbf{x}_{it})}{\hat{q}_{jt}^{RE}(\mathbf{x}_{it}) + \hat{q}_{jt}^{RM}(\mathbf{x}_{it})}$$

for each phrase to estimate $\rho_t^R(\mathbf{x}_{it})$. We define average Republican within-party partisanship for session t as

$$\bar{\pi}_t^R = \frac{1}{|R_t|} \sum_{i \in R_t} [\mathbf{q}_t^{RE}(\mathbf{x}_{it}) \cdot \rho_t^R(\mathbf{x}_{it}) + \mathbf{q}_t^{RM}(\mathbf{x}_{it}) \cdot (1 - \rho_t^R(\mathbf{x}_{it}))]$$

and estimate this quantity by replacing objects with their empirical analogues. We proceed analogously for the Democrats, and we estimate the model after randomly assigning each speaker-session to either the extreme or moderate wing of the speaker’s own party to produce the random series. Last, we form the within-party partisanship series shown in the figure as the average of the Republican and Democratic series.

Online Appendix Figure 19: Partisanship over Time for Phrases within Topics

Notes: Calculations are based on our preferred estimates from Panel A of Figure 3. Each plot shows the mean estimated value of 1,000 times the partisanship ζ_{jt} for the four Republican (Democratic) phrases in a given topic that have the highest (lowest) average partisanship across all sessions. Please see the body of the paper for the definition of partisanship ζ_{jt} .

Online Appendix Figure 20: Alternative Definition of Neologisms

Notes: The “baseline” series is our preferred estimate of average partisanship from Panel A of Figure 3. The other two series are based on the same parameter estimates. The “post-1980 vocabulary” series recomputes average partisanship exclusively on the set of phrases such that 99 percent of the occurrences of the phrase are after 1980 (the 96th session), while the “pre-1980 vocabulary” does so for the rest of phrases.
