## Internal Traction

$$\mathbf{T}(\mathbf{n}) = \lim_{dA \rightarrow 0} \frac{d\mathbf{P}(\mathbf{n})}{dA}$$

## Cauchy Stress $\mathbf{T}(\mathbf{n}) = \mathbf{n}\boldsymbol{\sigma}$

(Follows from Newton's laws for Cauchy Tetrahedron)

## Physical Interpretation of stress components

$\sigma_{ij}$

normal to plane

Direction of traction

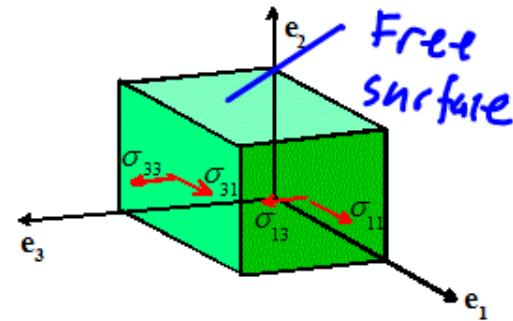

## Stresses at an external surface

$$\underline{t} = \underline{n} \underline{\sigma}$$

For a stress free surface  $\underline{n} \underline{\sigma} = 0$

(Show later that  $\underline{\sigma} = \underline{\sigma}^T$  to satisfy angular momentum conservation)

## Other stress measures

$$\text{Let } \underline{F} = \nabla \underline{y} = \underline{I} + \nabla \underline{u}$$

$$J = \det(F)$$

Define:

① Kirchhoff stress

$$\underline{\tau} = J \underline{\sigma}$$

Property (show later)  $\underline{\epsilon} : \underline{D}$  gives rate of work done on solid per unit ref volume

② Nominal stress (1<sup>st</sup> Piola-Kirchhoff stress)

$$\underline{S} = \underline{J} \underline{F}^{-1} \underline{\sigma}$$

[Also some authors use  $\underline{S} = \underline{J} \underline{\sigma} \underline{F}^{-T}$   
-transpose of our definition]

Property  $d\underline{P} = dA_0 \underline{n}_0 \underline{S}$

To see this note  $d\underline{P} = dA \underline{n} \underline{\sigma}$

Recall:  $dA \underline{n} = \underline{J} \underline{F}^{-T} dA_0 \underline{n}_0$

$$\Rightarrow d\underline{P} = dA_0 (\underline{J} \underline{F}^{-T} \underline{n}_0) \underline{\sigma} = dA_0 \underline{n}_0 \underbrace{\underline{J} \underline{F}^{-1}}_{\underline{S}} \underline{\sigma}$$

③ Material stress (2<sup>nd</sup> Piola-Kirchhoff stress)

$$\underline{\Sigma} = \underline{J} \underline{F}^{-1} \underline{\sigma} \underline{F}^{-T}$$

Physical interpretation: define "reference" force vector satisfying  $d\underline{P} = \underline{F} d\underline{P}^0 = d\underline{P}^0 \underline{F}^T$

$$d\underline{P}^0 = dA_0 \underline{n}_0 \underline{\Sigma}$$

To see this note  $d\underline{P} = d\underline{P}^0 \underline{F}^T$

$$d\underline{P} = dA \underline{n} \underline{\sigma} = dA_0 \underline{n}_0 \underbrace{\underline{J} \underline{F}^{-1} \underline{\sigma} \underline{F}^{-T}}_{\underline{\Sigma}} \underline{F}^T$$

$$\underbrace{\hspace{10em}}_{d\underline{P}^0}$$
