# Pentaquark antidecuplet

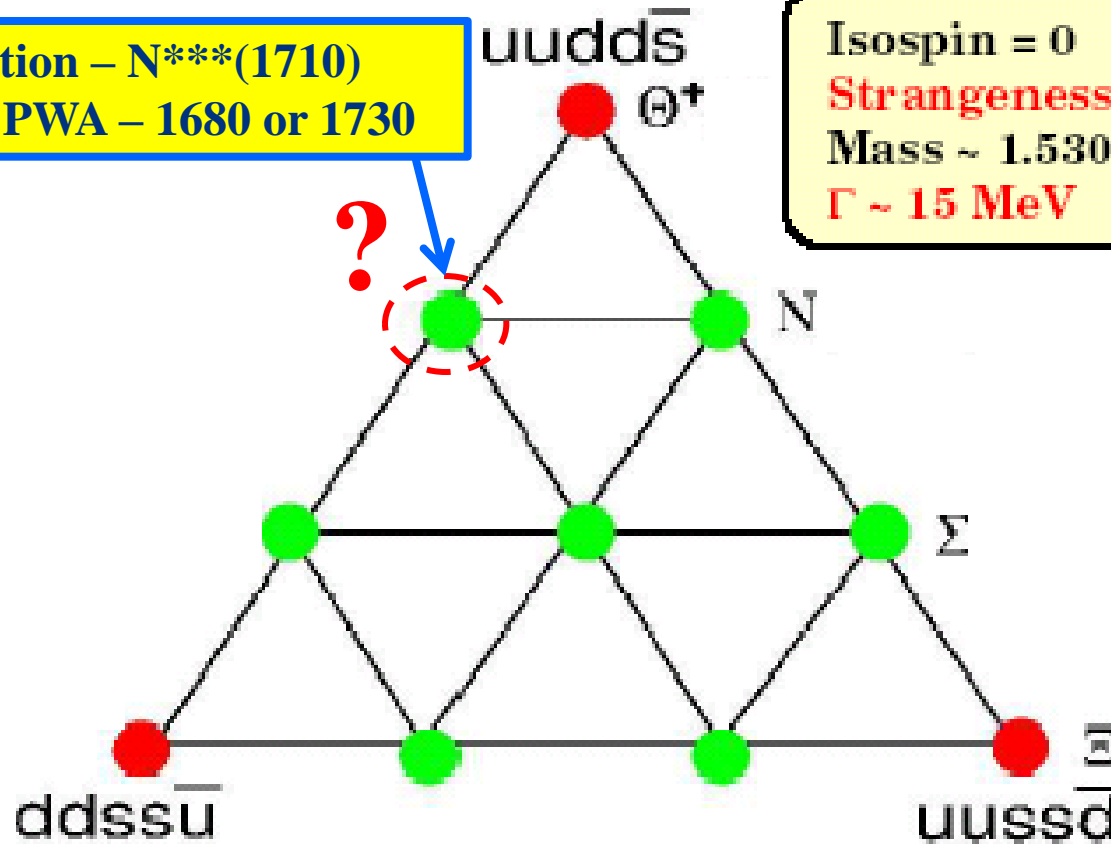

$[\bar{10}]$  Spin =  $\frac{1}{2}$  NEW MULTIPLET

D.Diakonov et al. Z. Phys A359, 1997, 305

Original prediction –  $N^{*}(1710)$   
From modified PWA – 1680 or 1730

Isospin = 0  
Strangeness = +1  
Mass ~ 1.530 MeV  
 $\Gamma$  ~ 15 MeV

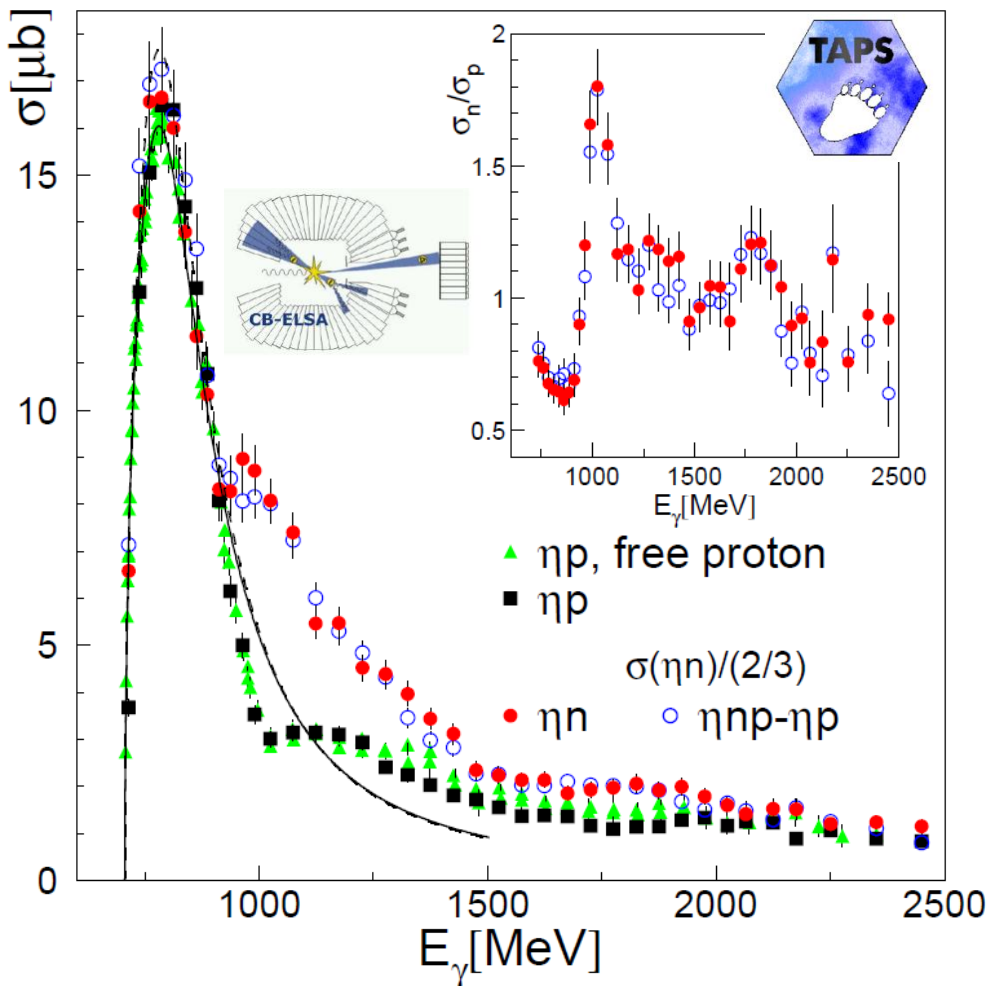

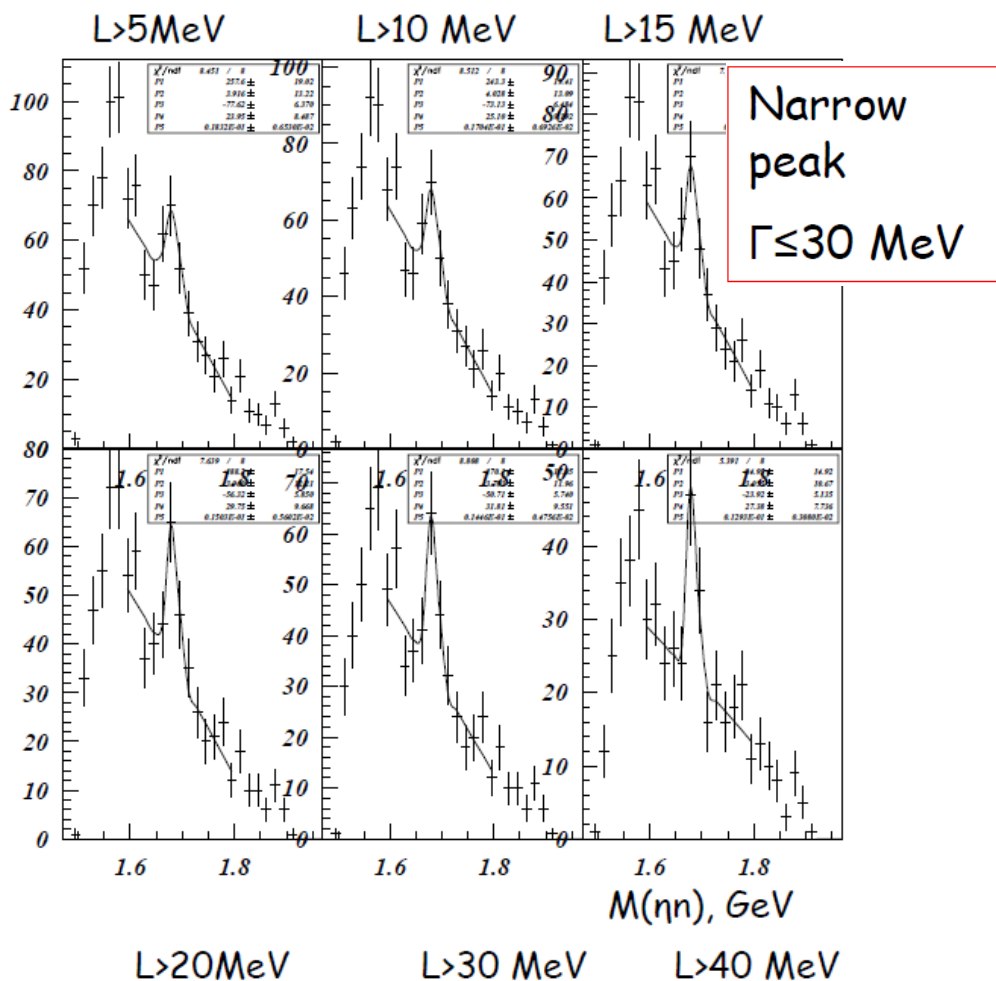

# N(1685)

NNR'2009, Edinburg, June 8-10, 2009

## $\eta$ -photoproduction off neutron

GRAAL: V.Kuznetsov, NNR Workshop, June 8 - 10 2009, Edinburg

B. Krusche, Narrow Nucleon Resonances, Edinburgh, June 2009

$$\pi^- p \rightarrow \pi^- p \quad \text{and} \quad \pi^- p \rightarrow K_S^0 \Lambda$$

## What is special in our experiment:

- “Formation”-type experiment (s-channel).
- Extremely high invariant mass resolution (**~0.6 MeV**), provided by high momentum resolution of the magneto-optic channel **0.1%**.
- Magnetless spectrometer with drift chambers.
- Liquid hydrogen target.
- Very small amount of matter on the particle paths.
- High statistical precision: 0.5% for elastic scattering and 1% for  $K\Lambda$ -production.

## Not only pentaquark...

- Precise cross section measurements:
  - $\pi^- p \rightarrow \pi^- p$ :  $d\sigma/d\Omega$  – **0.5%** statistical precision and **1 MeV momentum** step
  - $\pi^- p \rightarrow K^0 \Lambda$ :  $\sigma_{\text{REAC}}$  – **1%** statistical precision and the same step
  - ⇒ Very important data for PWA
- Usual resonance P11 N(1710)\*\*\*
- $\Lambda$ -polarization in the reaction  $\pi^- p \rightarrow K^0 \Lambda$  - an order of magnitude better precision than the best data available now - NIMROD (78)

# Setup for elastic scattering

⊙ Proportional chambers with 1mm pitch and 40 um aluminum foil potential electrode in the first focus (1FCH1-4) and in front of the target (2FCH1-4).

⊙ Liquid hydrogen target with beryllium outer shell and mylar hydrogen container. The target diameter is 40 mm and the length along the beam  $\sim 250$  mm.

⊙ 8 modules of drift chambers with hexagonal structure to measure tracks of particles produced.

⊙ Trigger scintillation counters S1, S2, A1.

⊙ NMR system for measurement field in the magneto-optic channel dipoles with precision better 0.1%.

⊙ Triggers:

$$\text{Main} = S1 \cdot 1FCH \cdot S2 \cdot 2FCH \cdot (!A1)$$

With prescale:

$$\text{Mom1F} = S1 \cdot 1FCH \cdot S2 \cdot 2FCH$$

$$\text{BeamPos} = S1 \cdot 1FCH \cdot 2FCH \cdot A1$$

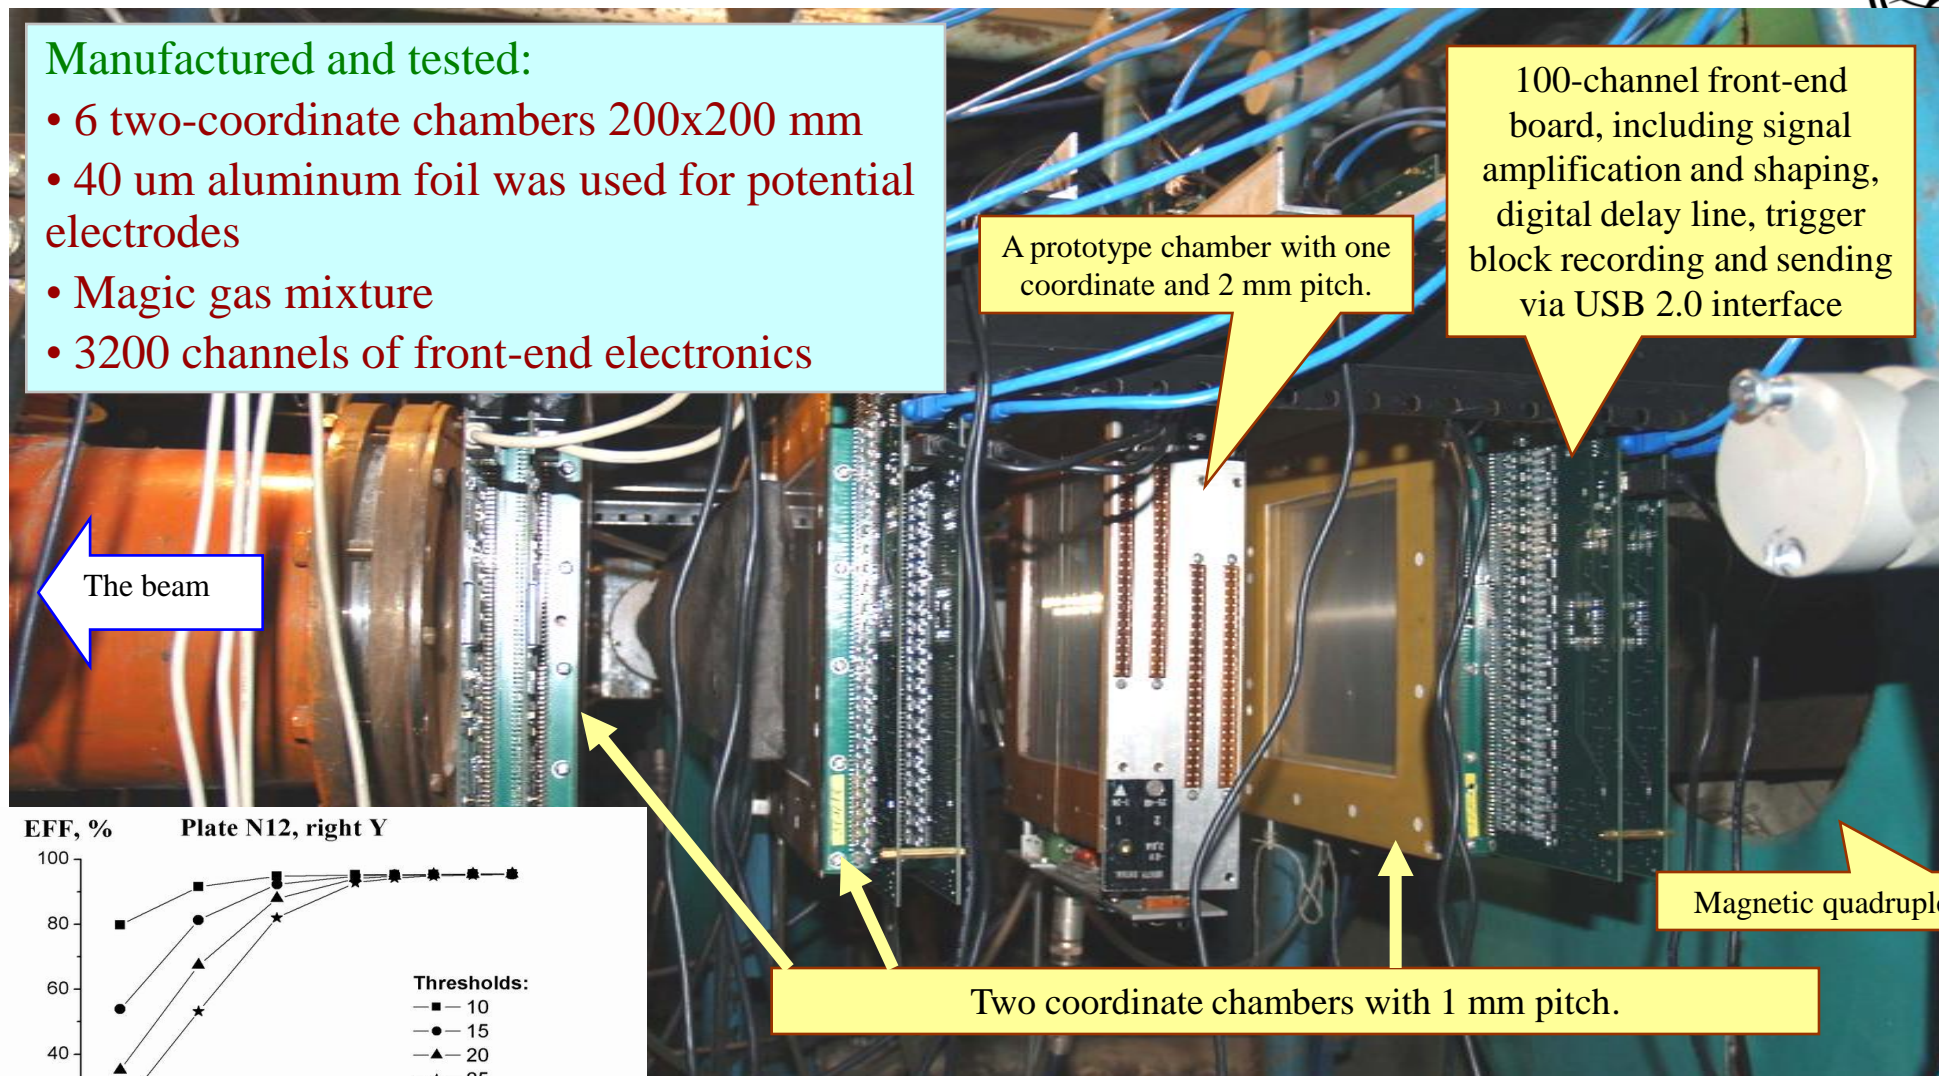

# Proportional chambers with 1 mm pitch

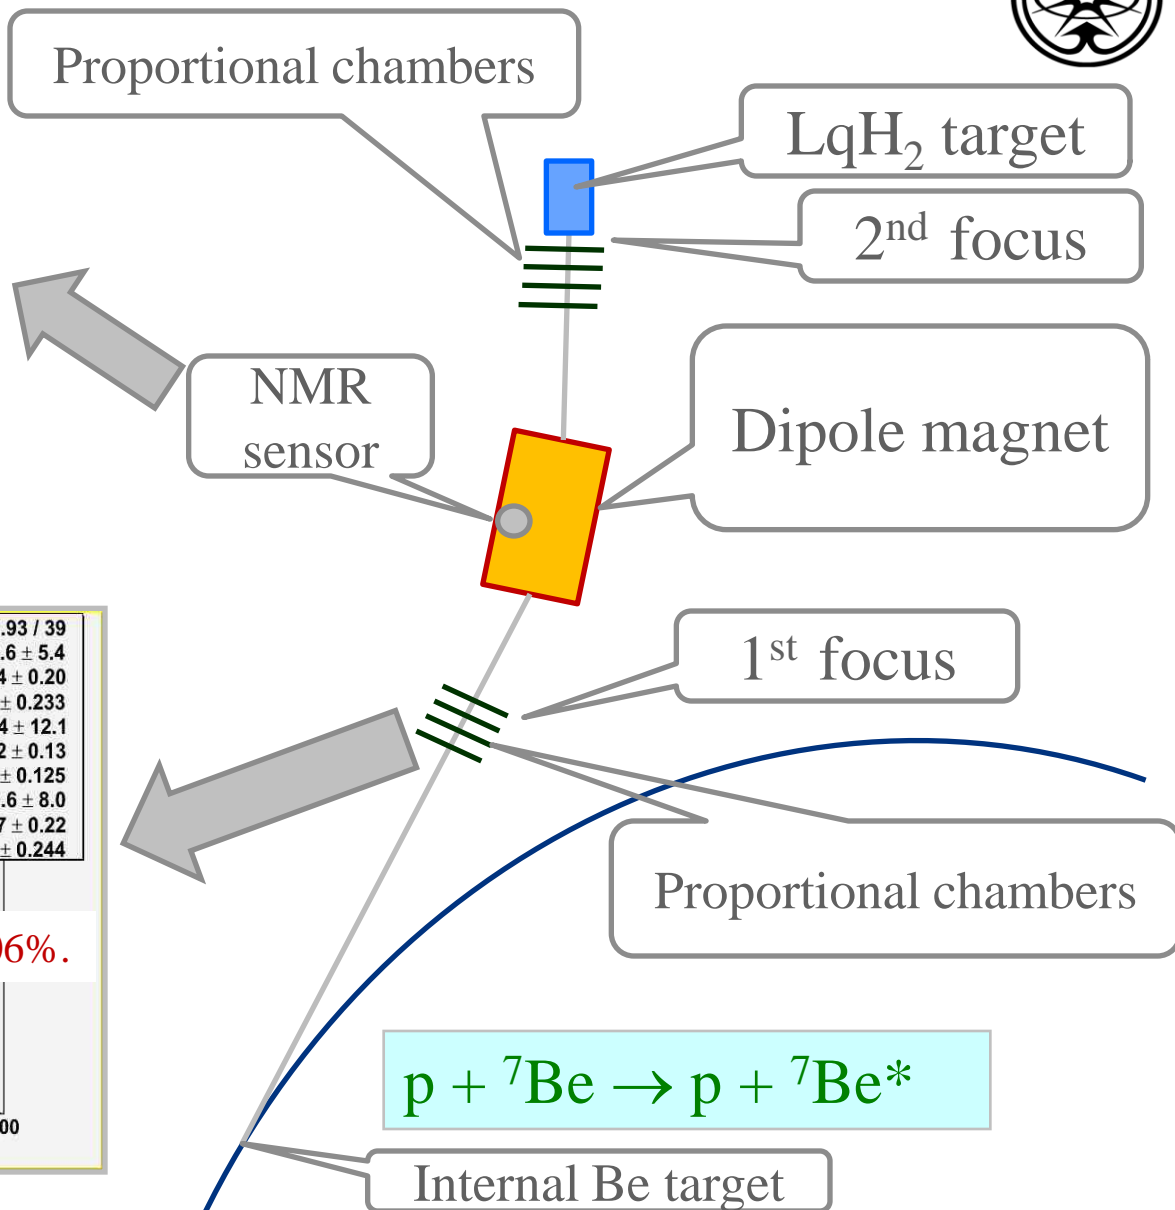

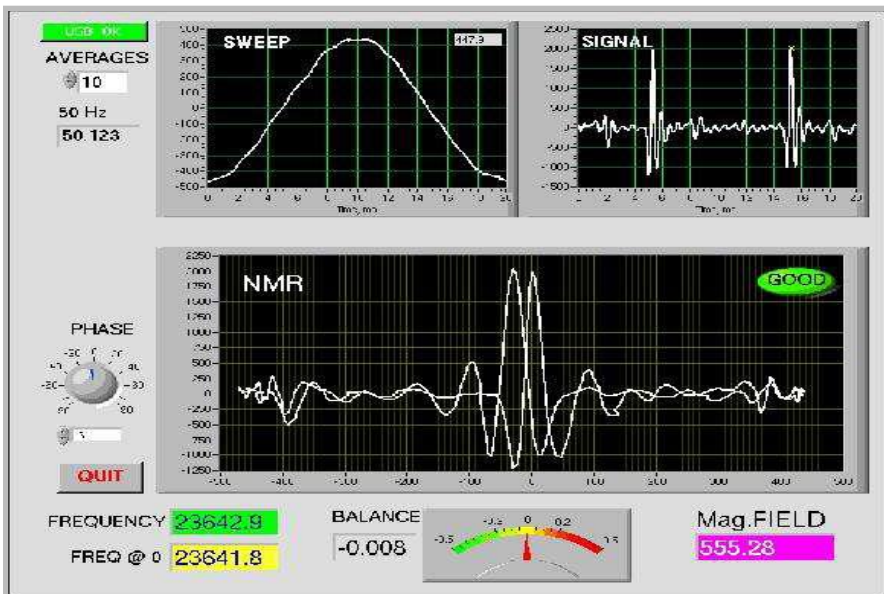

## Manufactured and tested:

- 6 two-coordinate chambers 200x200 mm
- 40  $\mu\text{m}$  aluminum foil was used for potential electrodes
- Magic gas mixture
- 3200 channels of front-end electronics

Proportional chambers in the first focus of the magneto-optic channel

# Momentum calibration and resolution

Calibration points 1.06, 1.20 and 1.30 GeV/c

# Liquid hydrogen target

- The mylar container L=25 cm,  $\varnothing$ 40 mm.
- Beryllium outer shell
- Tested with liquid neon and hydrogen.

While filling with hydrogen

# Drift chambers with hexagonal structure

Drift chamber module “X” (wires along the short side) under test at ITEP accelerator. A “Y” module could be seen behind the “X” module.

# Engineering run (December 2008)

7 millions of triggers were written with the liquid hydrogen target

Drift chambers

Proportional chambers

Hodoscope

Liquid hydrogen target heat exchanger

# Statistics so far 2.97 billion triggers

**Many thanks to ITEP accelerator!**

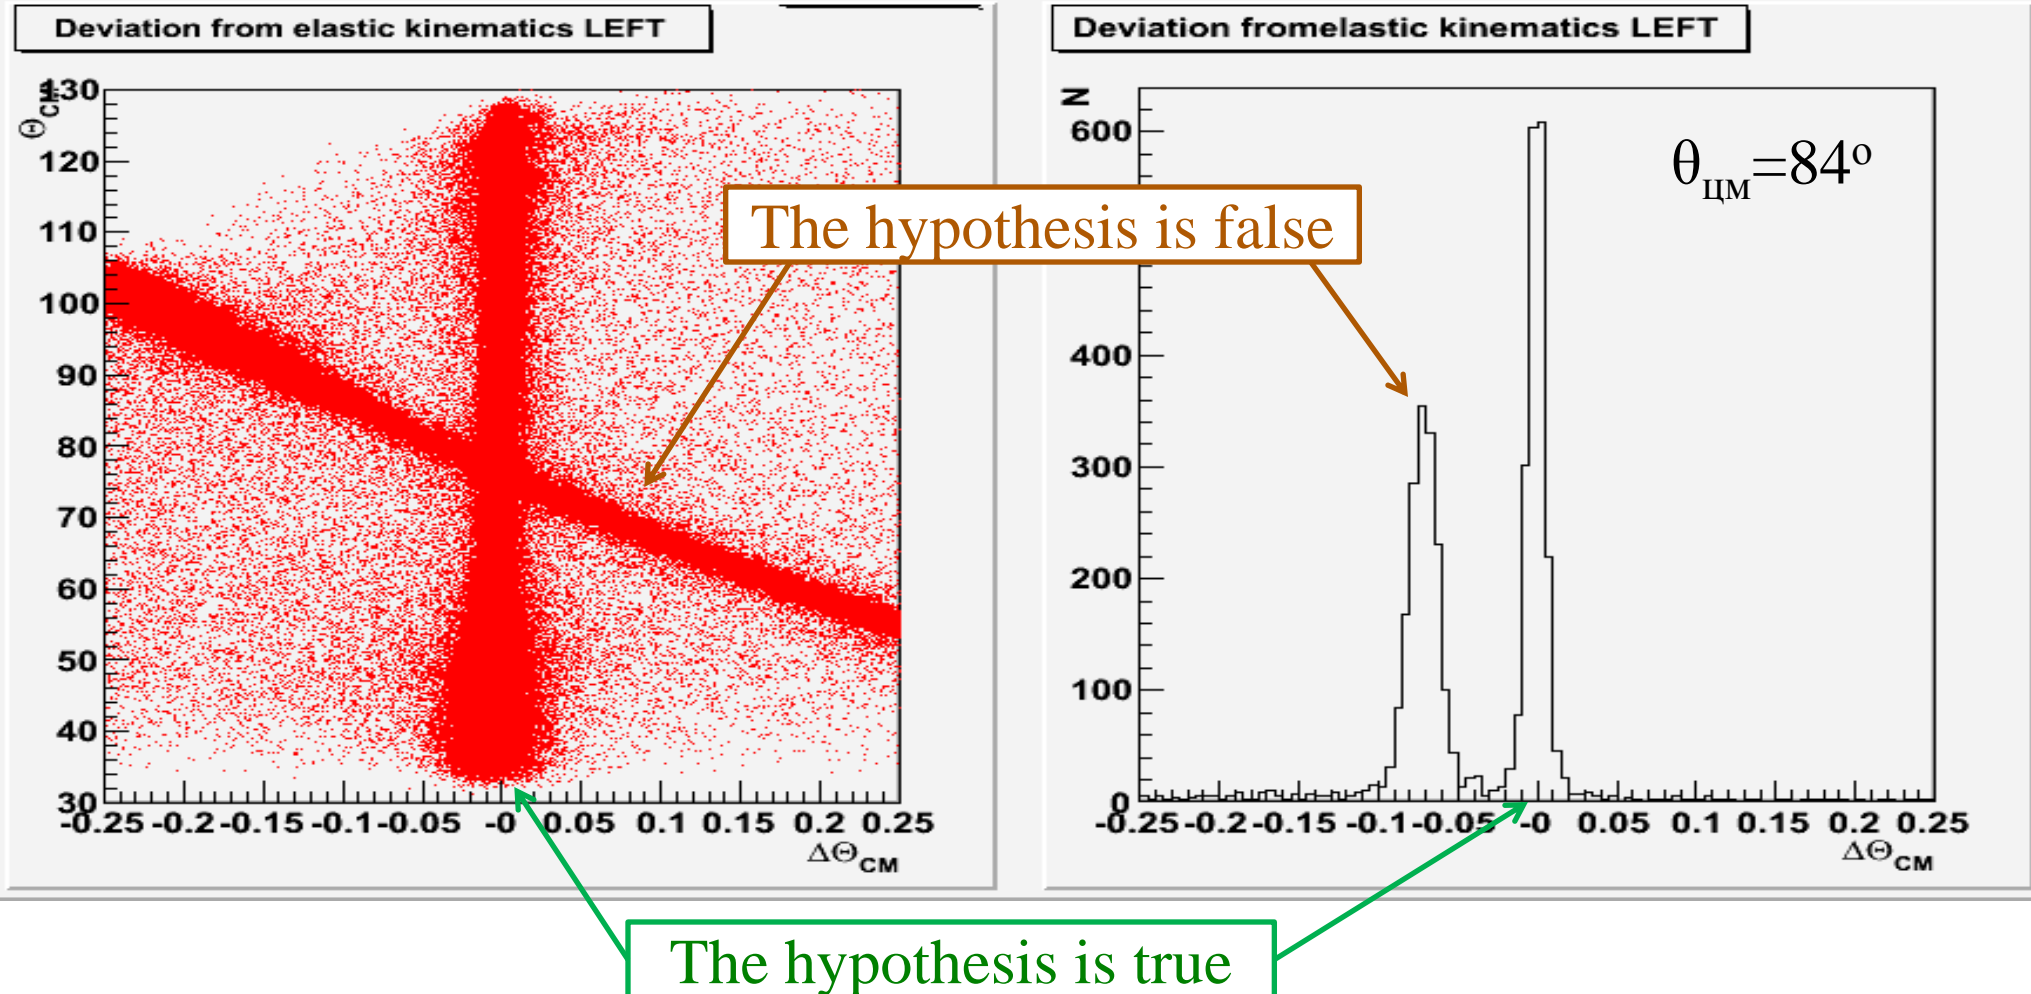

# Elastic events selection

Hypothesis – pion scattered to the left arm

# Raw angular distribution (unnormalized)

Number of elastic events vs c.m. scattering angle

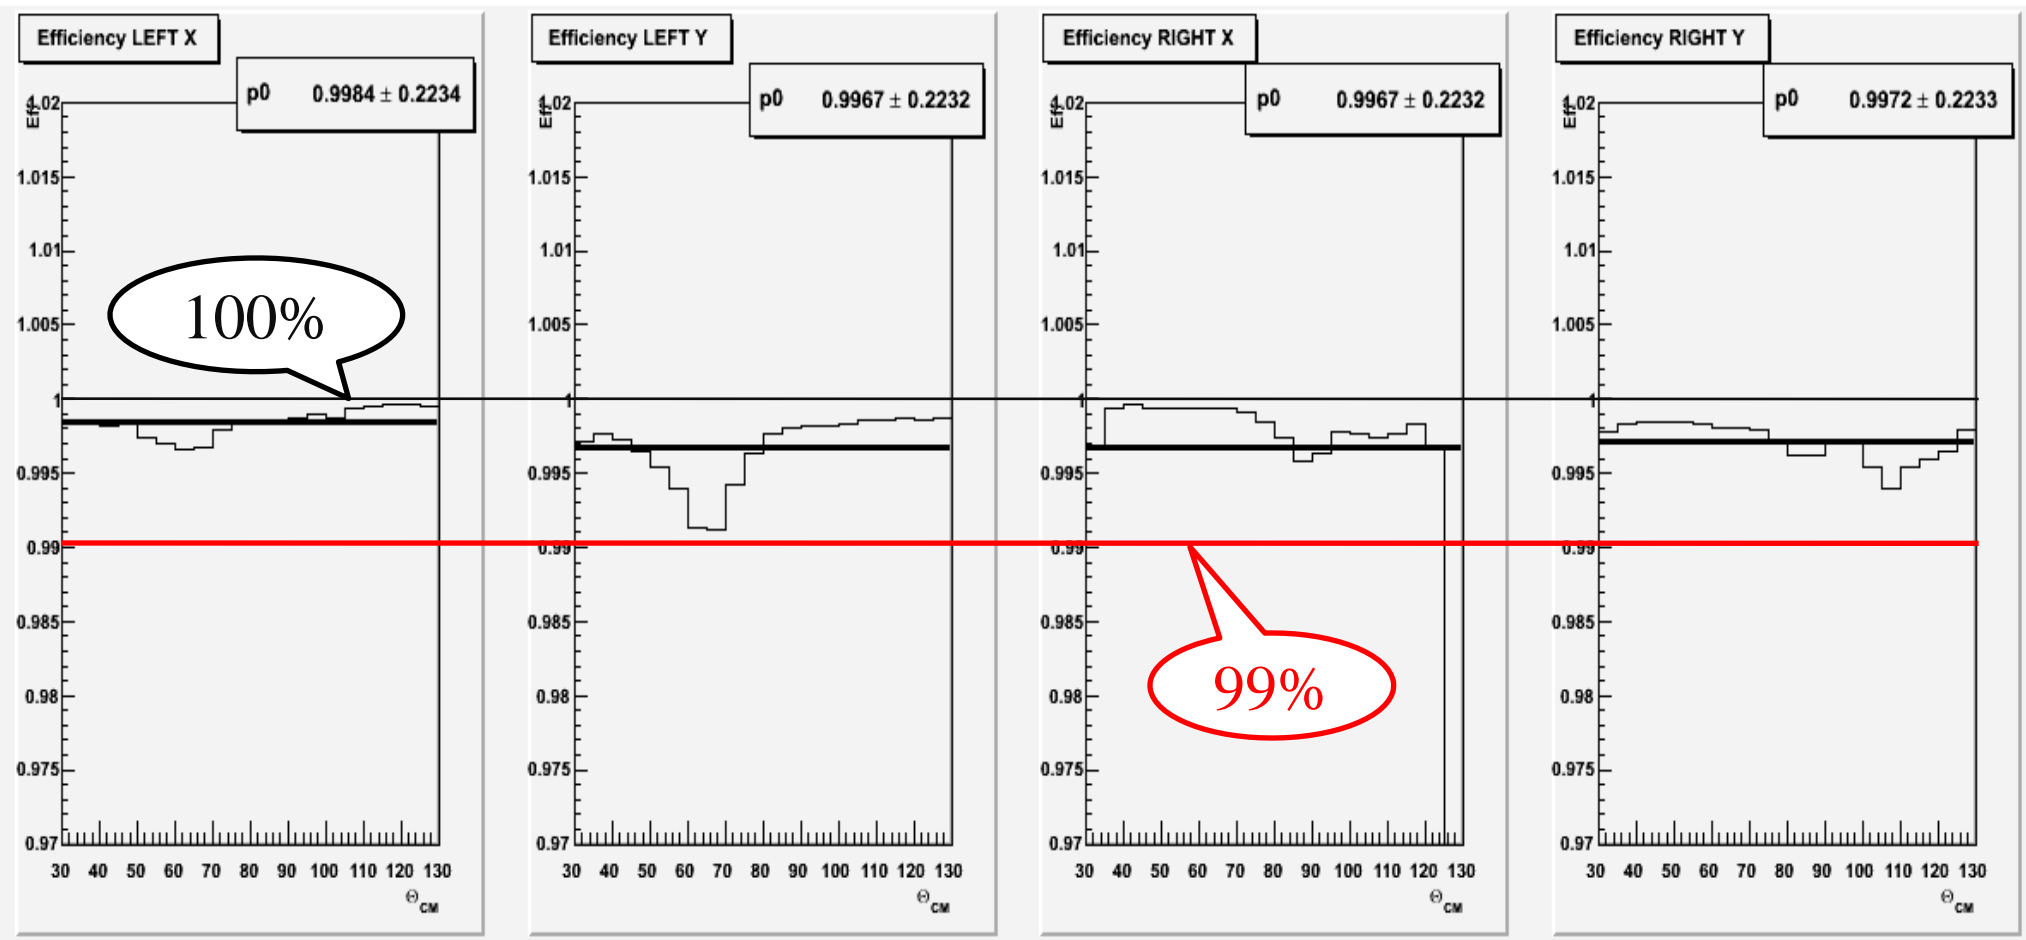

h142	
Entries	100
Mean	76.16
RMS	30.24

# Track reconstruction efficiency

We require 3 hits on the track out of 4 possible in each projection

# Acceptance, decays etc.

(very preliminary)

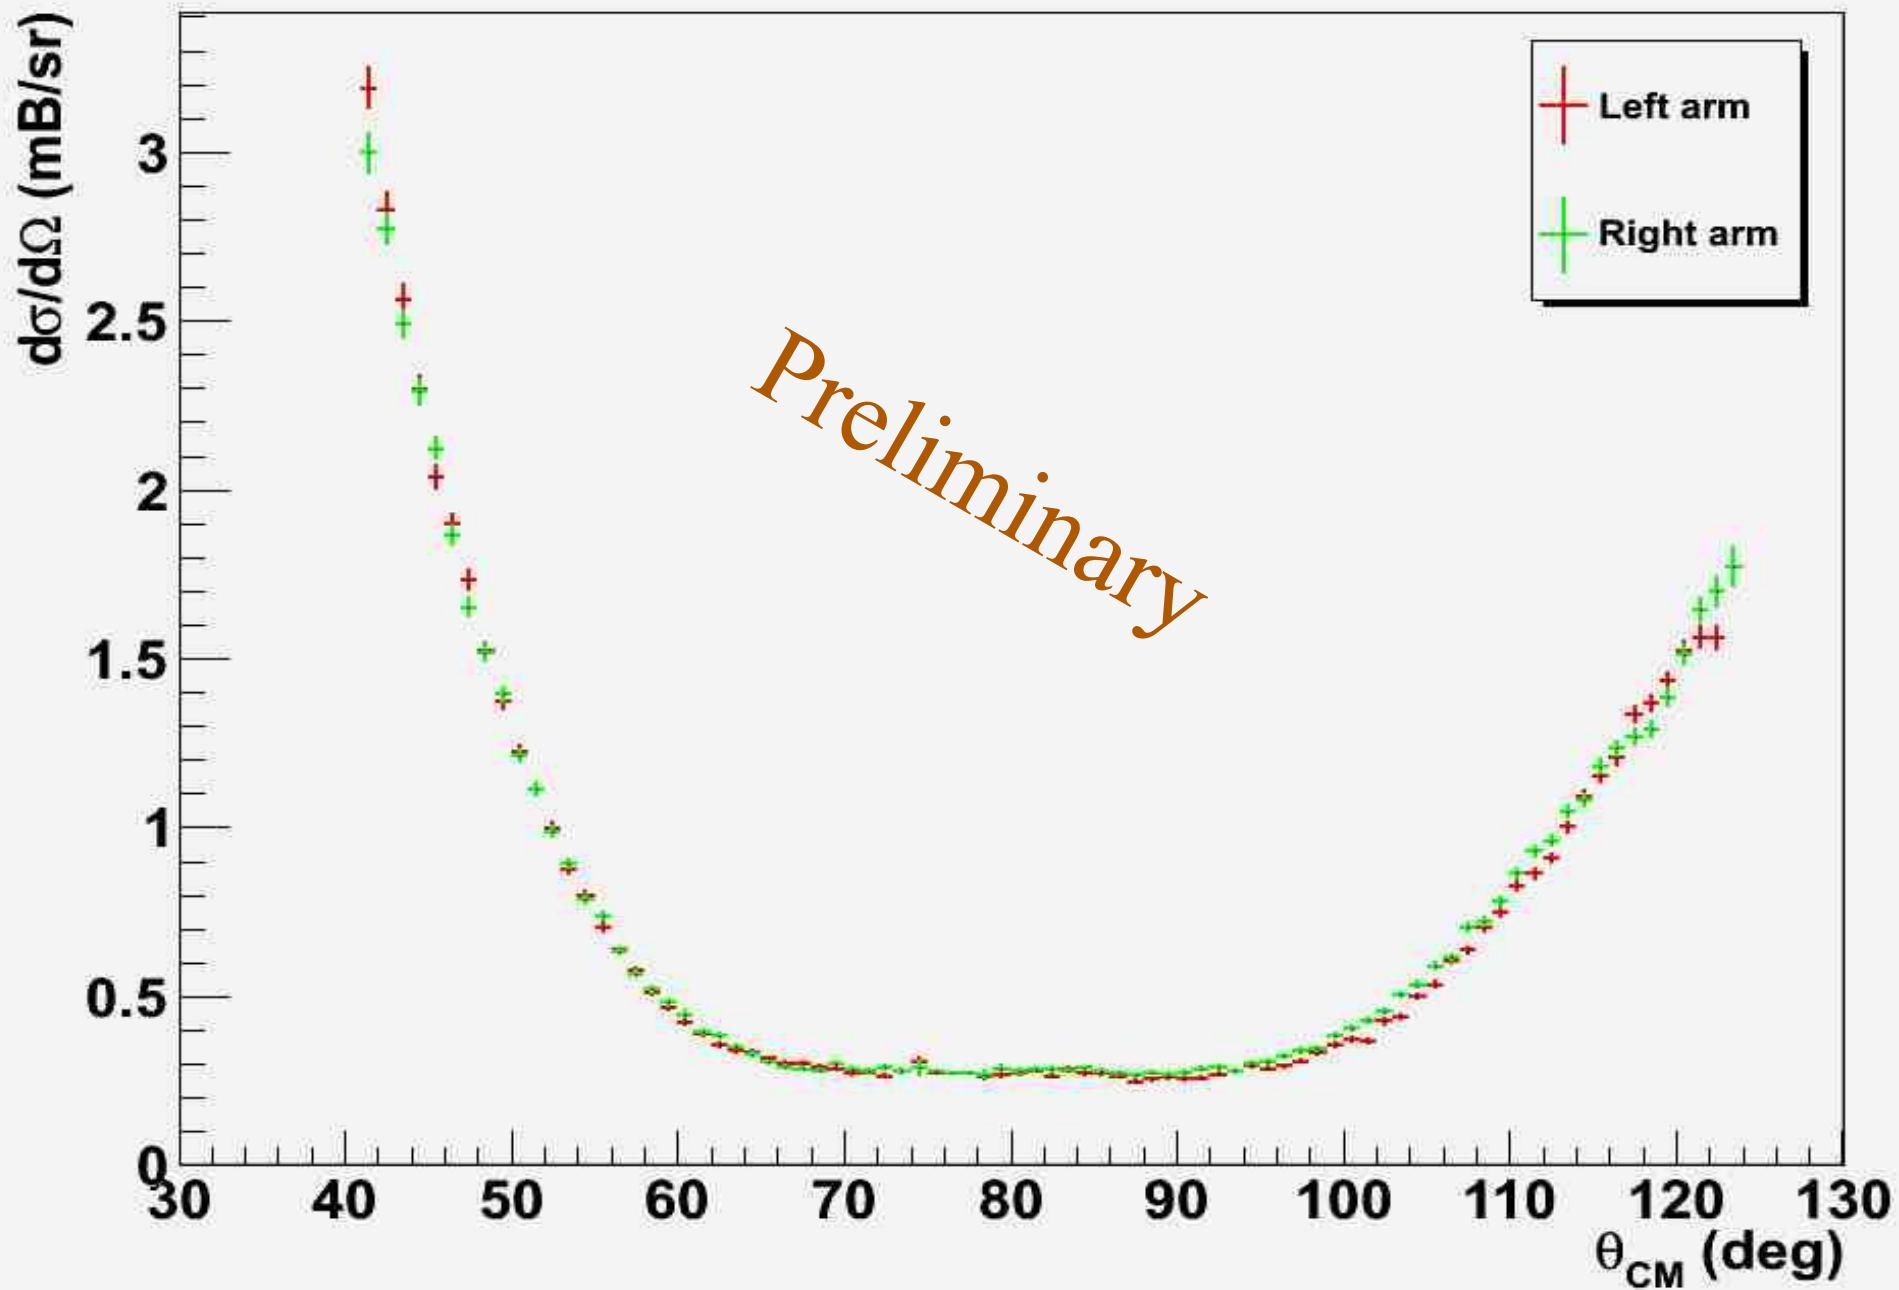

- ✓ We start with array of real tracks written with trigger Mom1F.
- ✓ With 1 mm step along the beam,  $1^\circ$  in the scattering angle in the CM-system and 10 MeV/c in momentum random azimuth angles are played and if the straight trajectories will hit the chambers is checked.

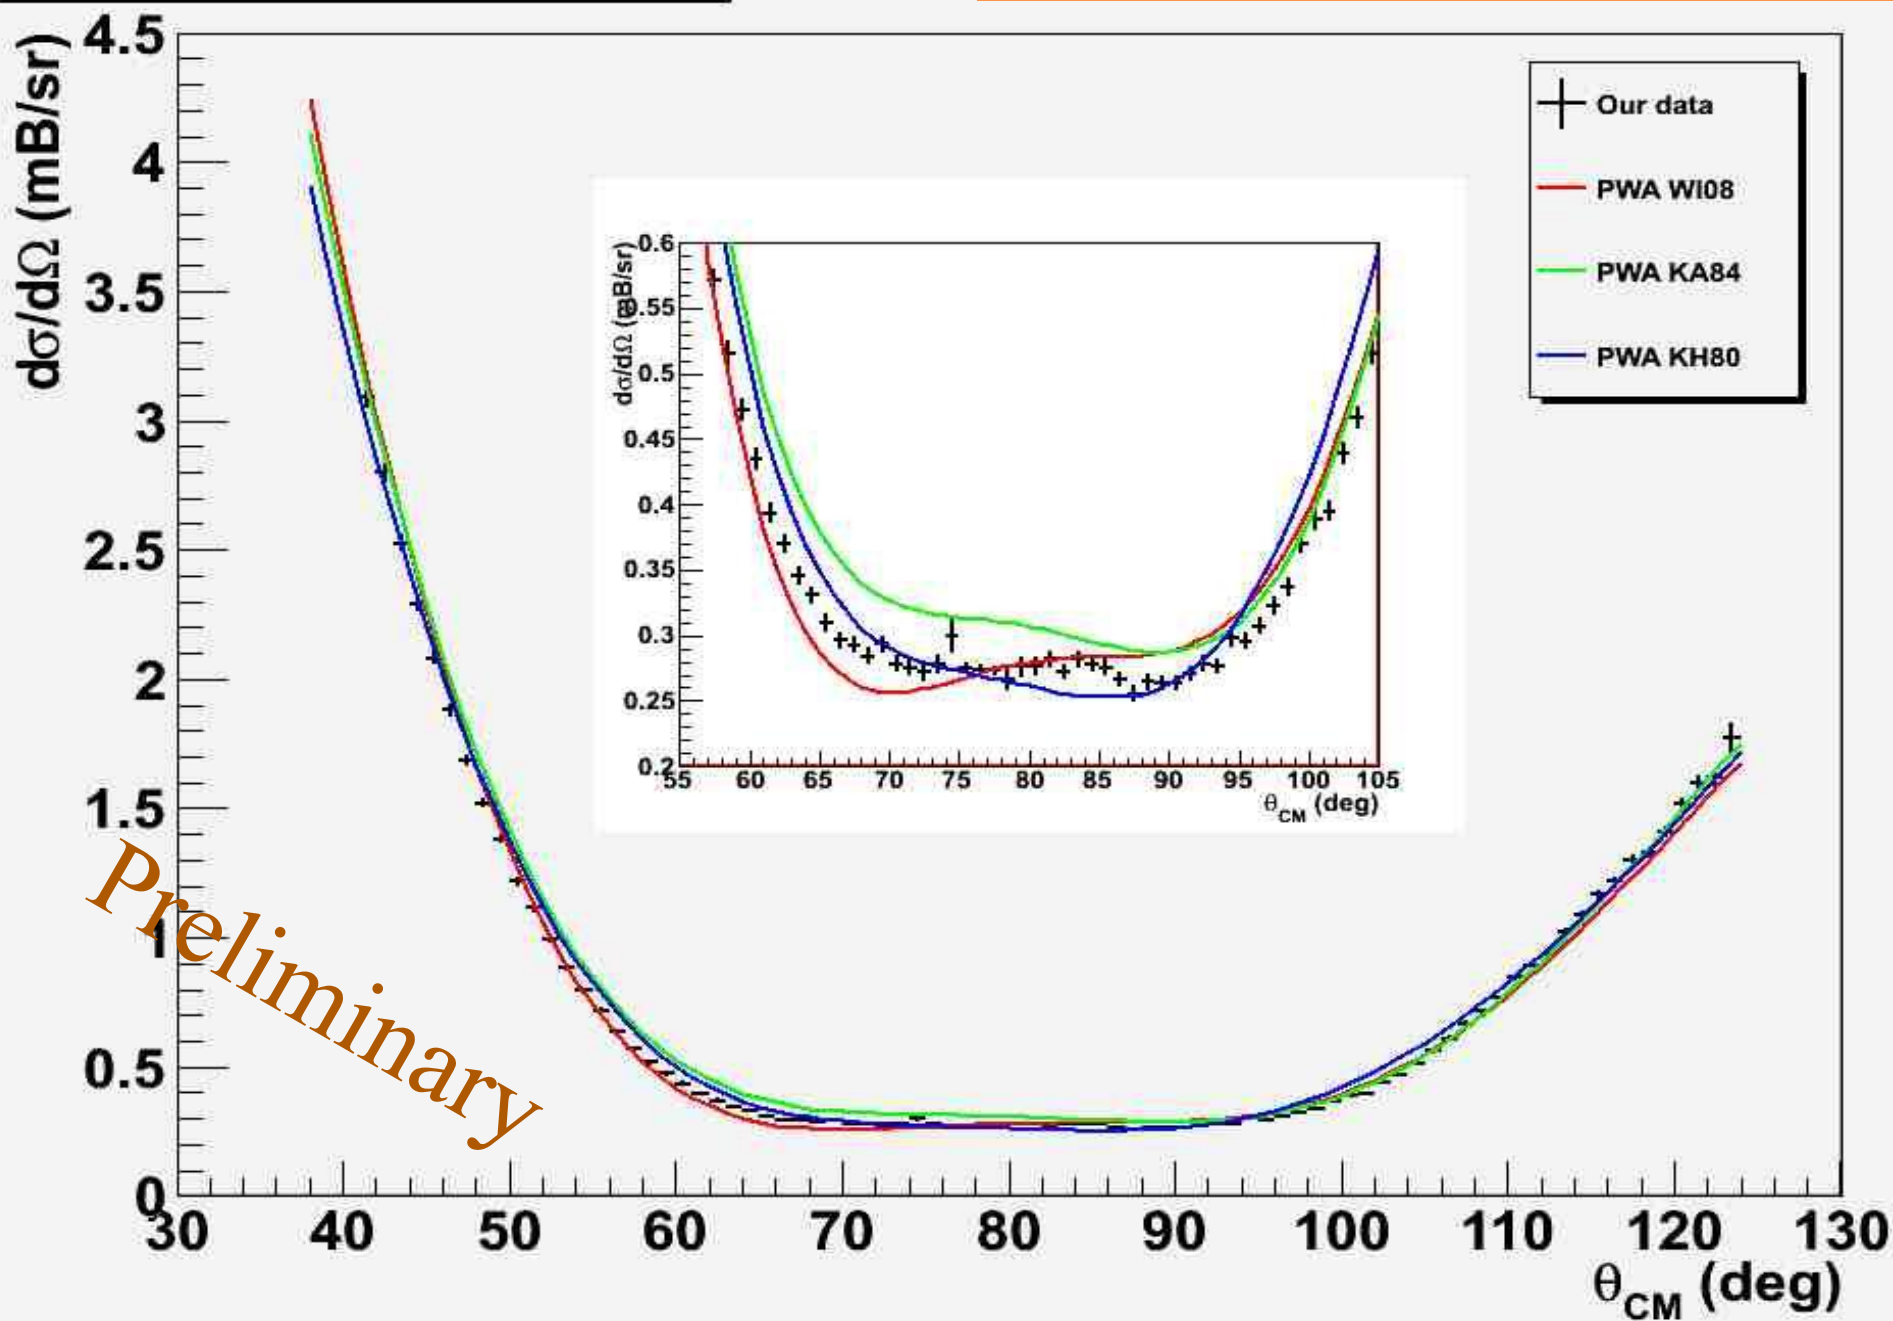

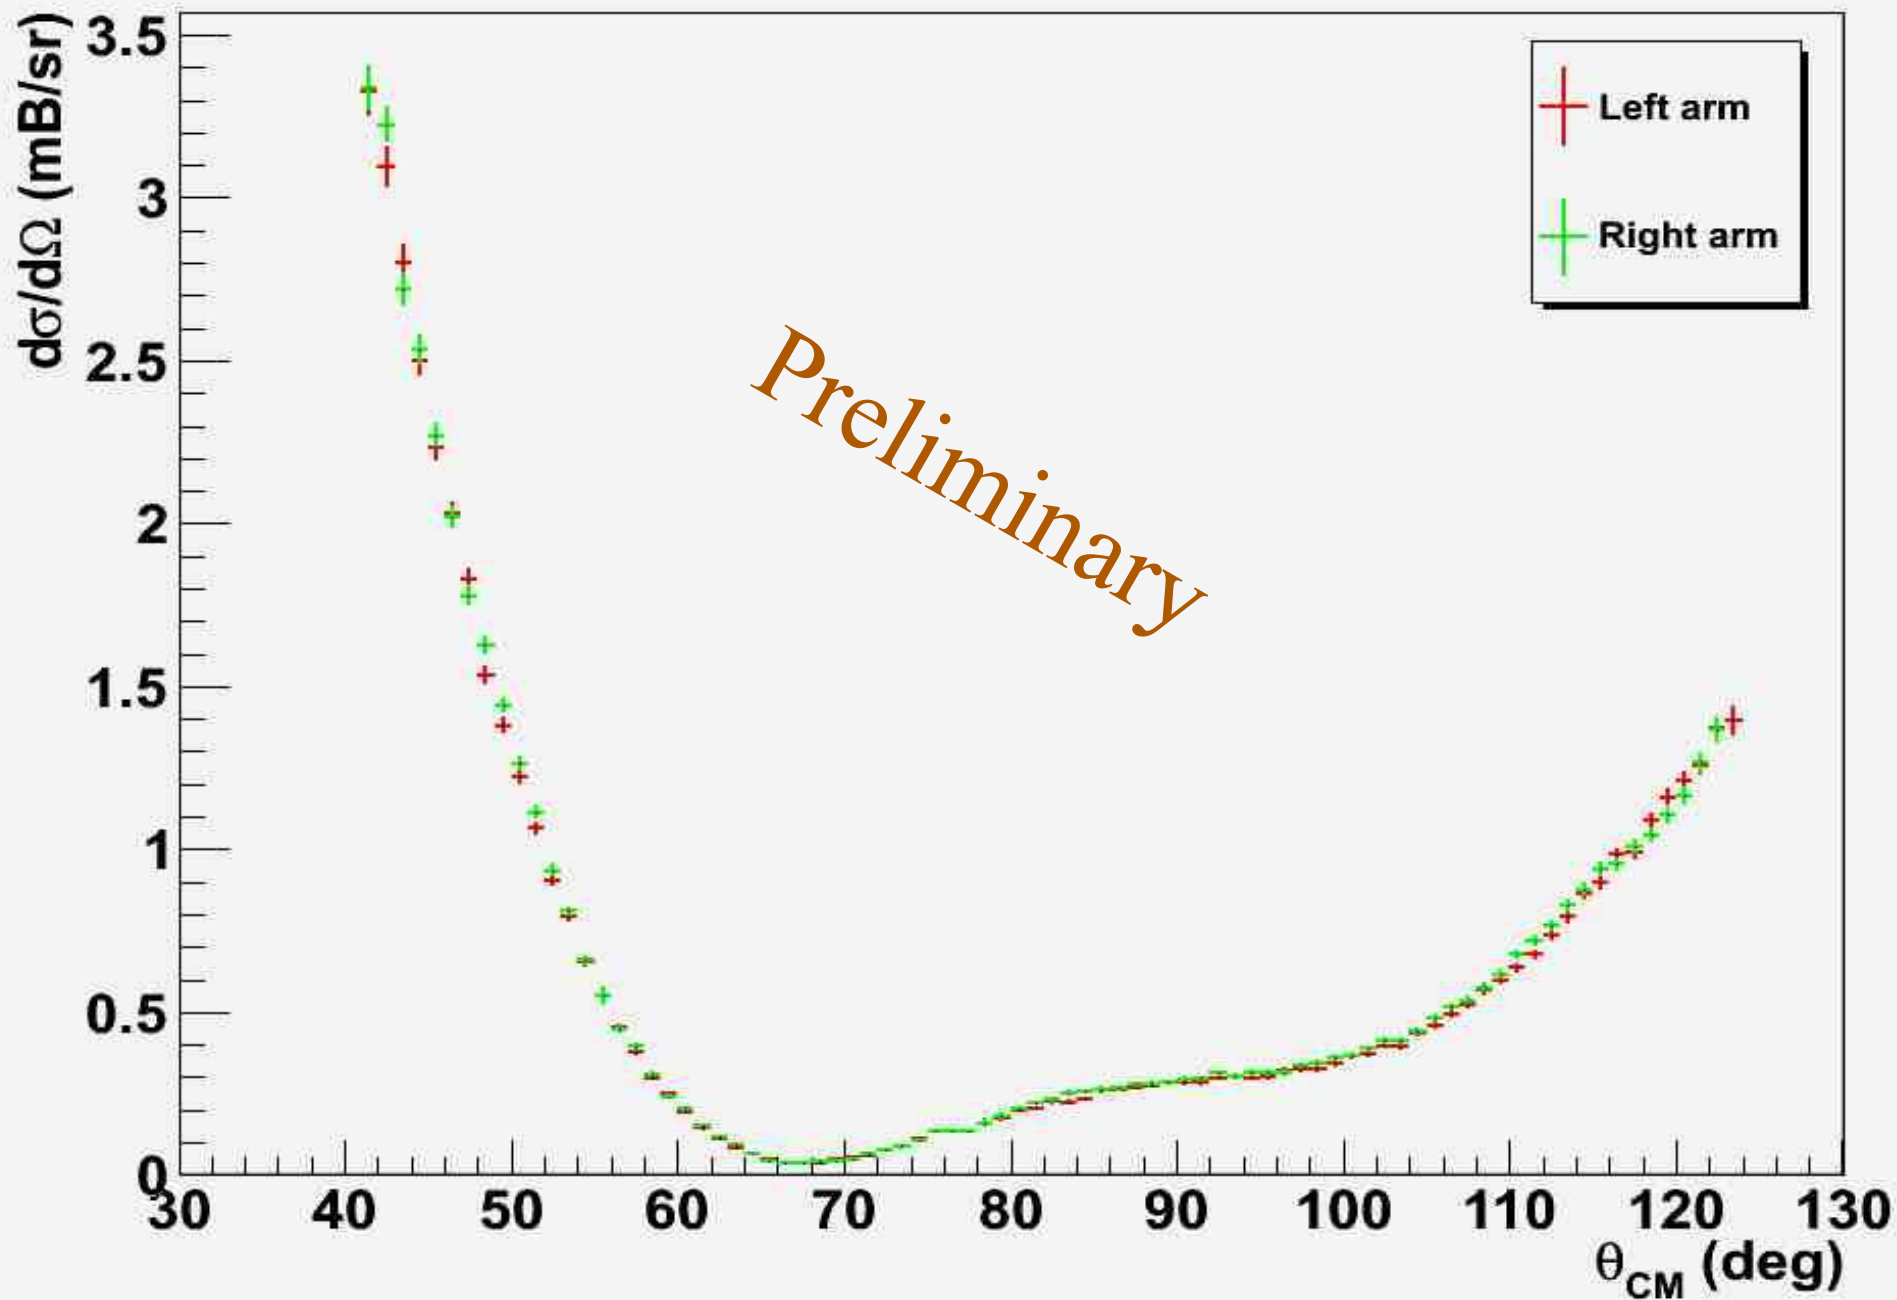

- ✓ An acceptance as a function of  $\theta_{\text{CM}}$ ,  $P_{\text{beam}}$  and  $z$  is created.
- ✓ For each event we introduce its weight based on the acceptance interpolated to the particular event kinematic parameters, tracking efficiency and correction to the decays and interactions.

- ❖ Standard Monte-Carlo simulations are under way based on Geant.
- ❖ We are in the preparation for measurement of the beam muon and electron contamination using gas Cherenkov counter. We are also going to perform Monte-Carlo simulation of the decays after the beam optics.

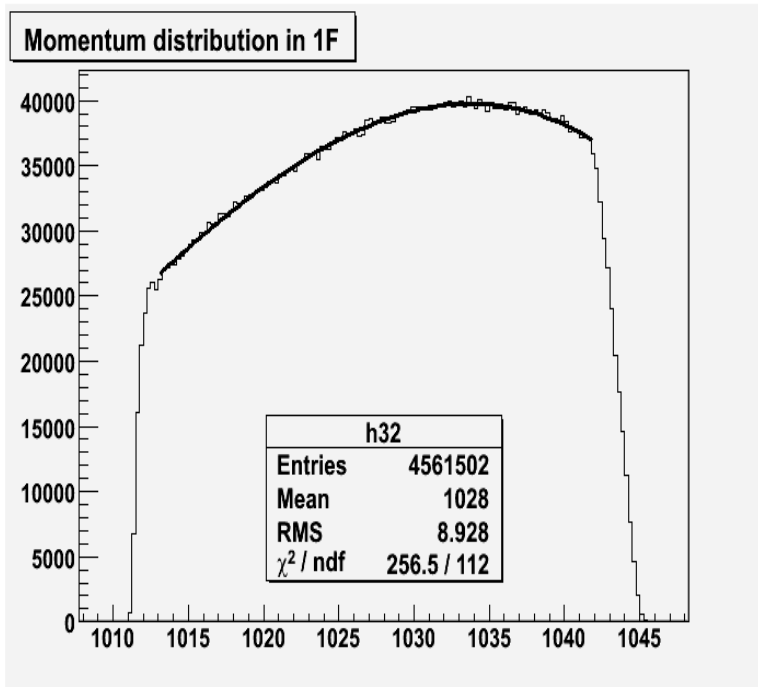

$\pi^-p, P_{\text{lab}} = 1060 \text{ MeV}/c$

Corrected to the acceptance, efficiency and decays

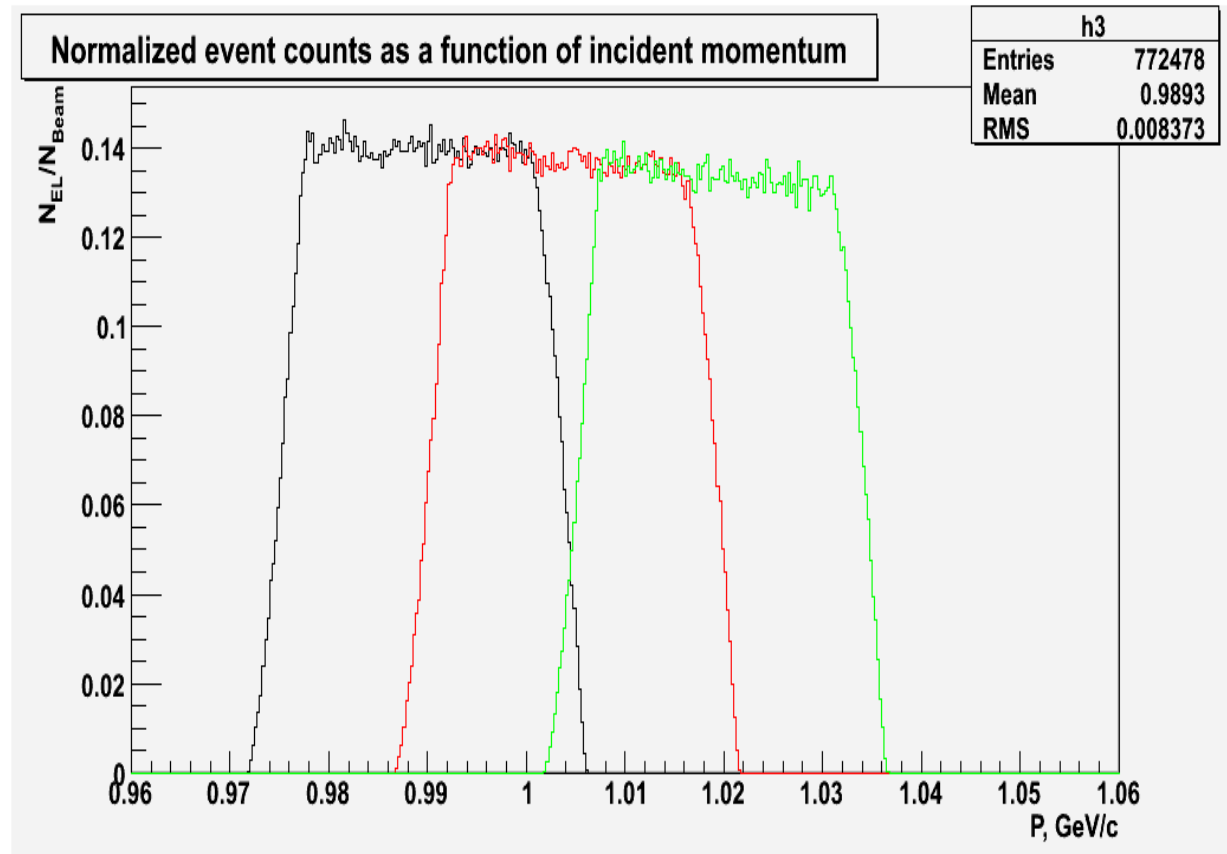

# Neighbor momentum intervals match

The momentum distribution with single beam optics setting from Mom1F-trigger.

Normalized counts of the elastic events measured with 3 consecutive beam optics settings. The match in the overlapping regions is better than 0.7%.

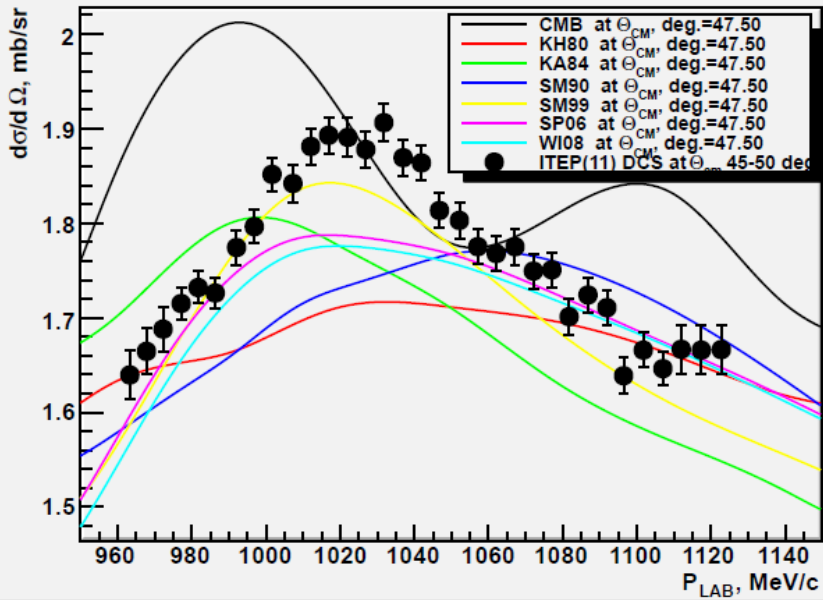

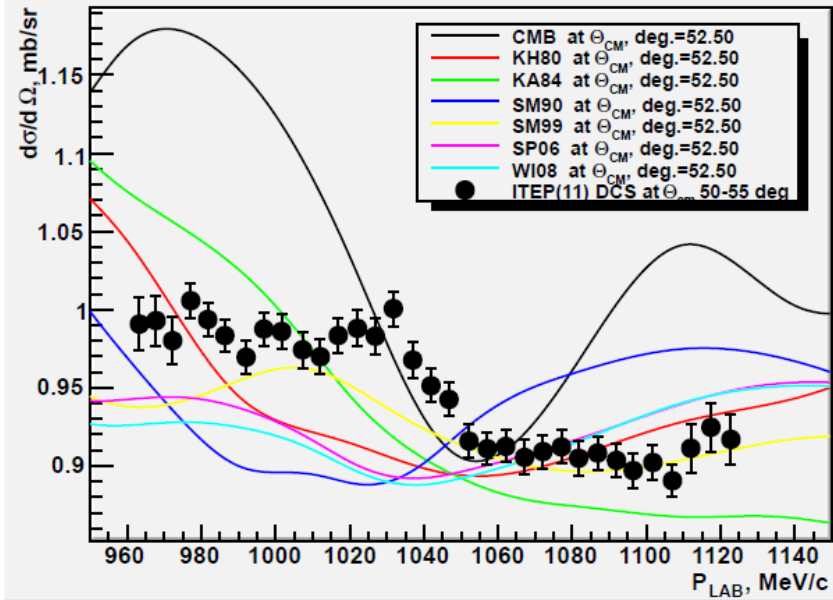

Statistical errors only

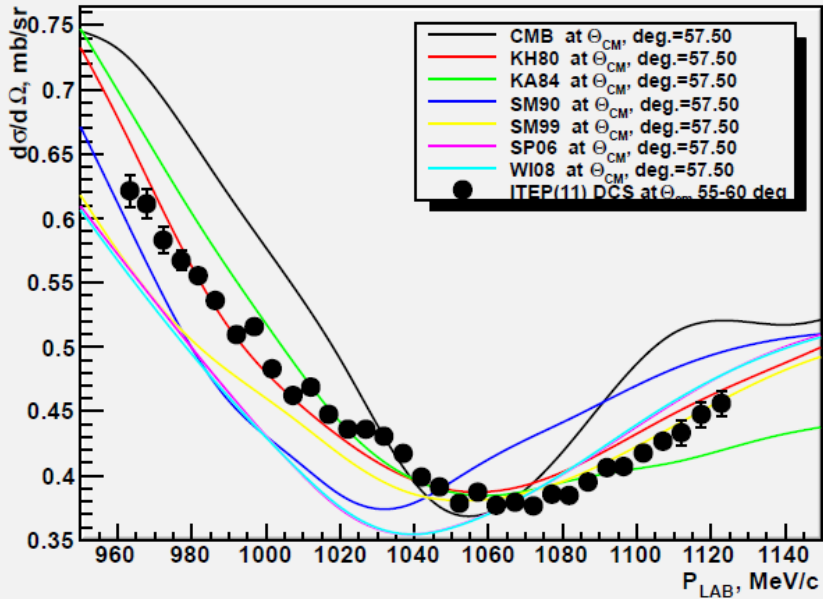

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+p$

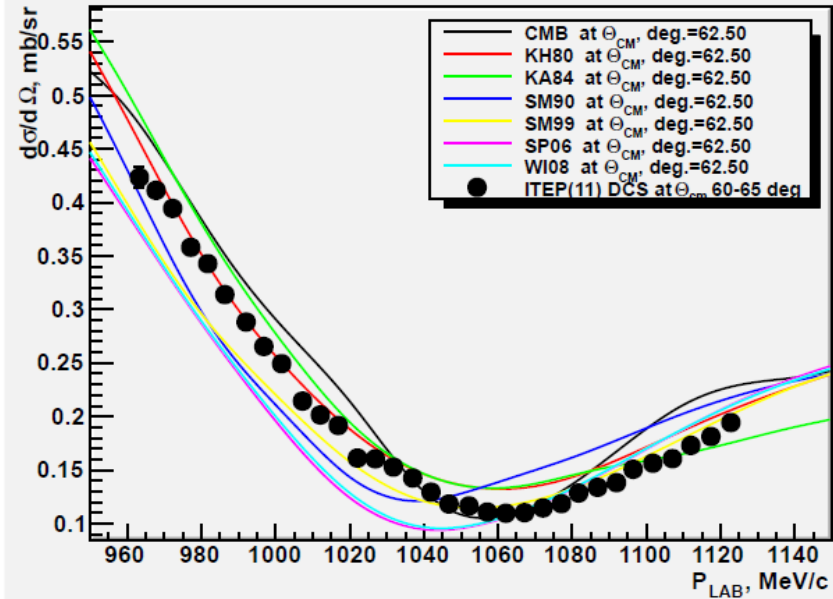

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+p$

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+p$

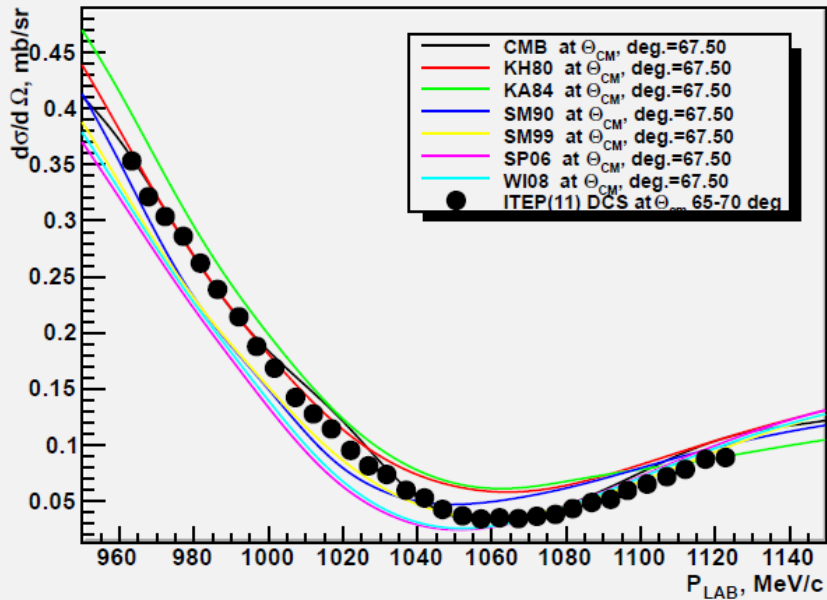

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+p$

Statistical errors only

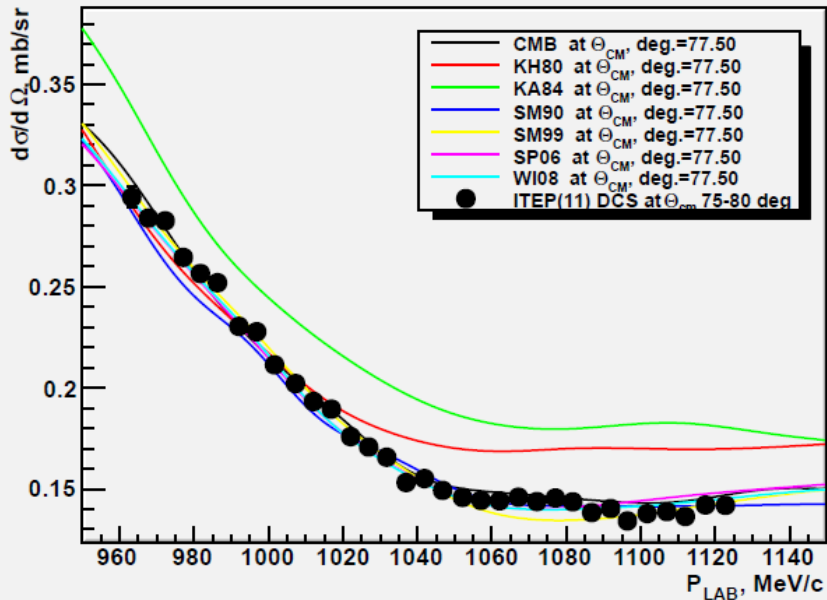

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+\pi^-$

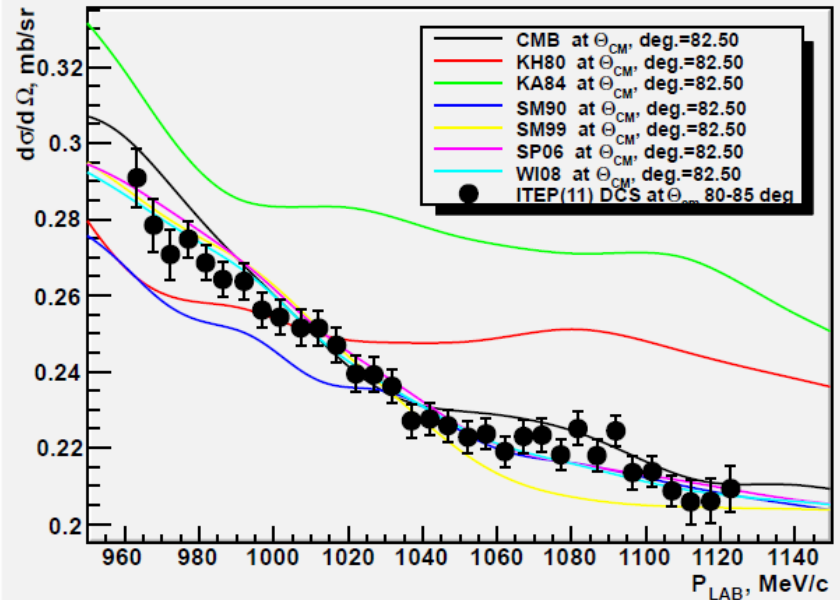

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+\pi^-$

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+\pi^-$

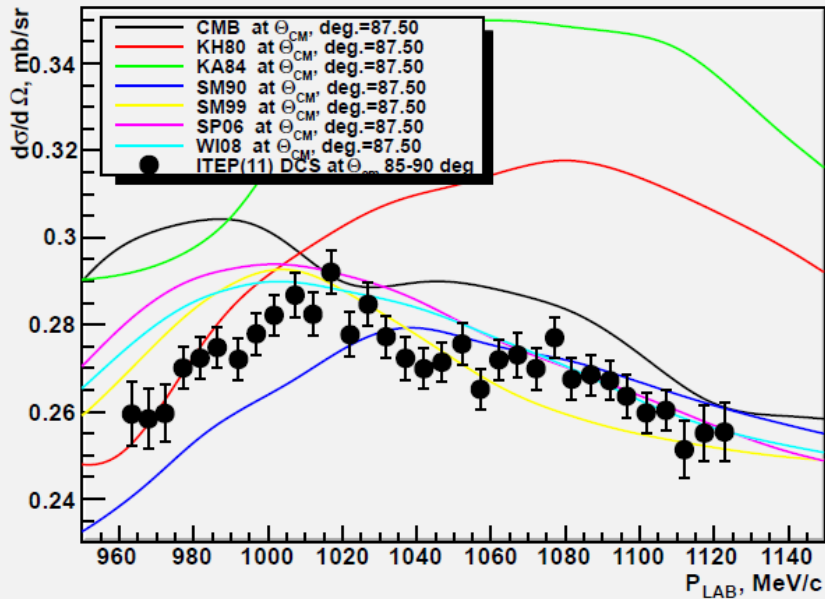

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+\pi^-$

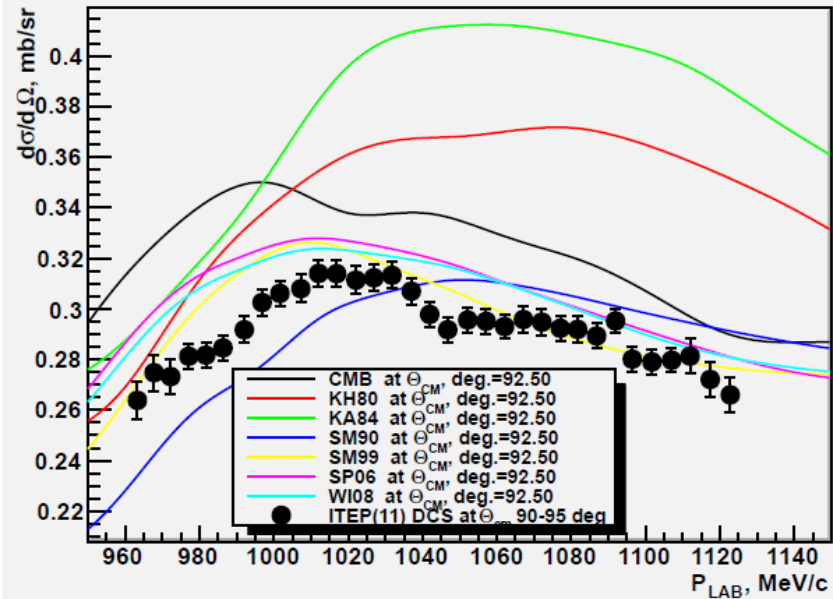

Statistical errors only

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+\pi^-$

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+\pi^-$

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+\pi^-$

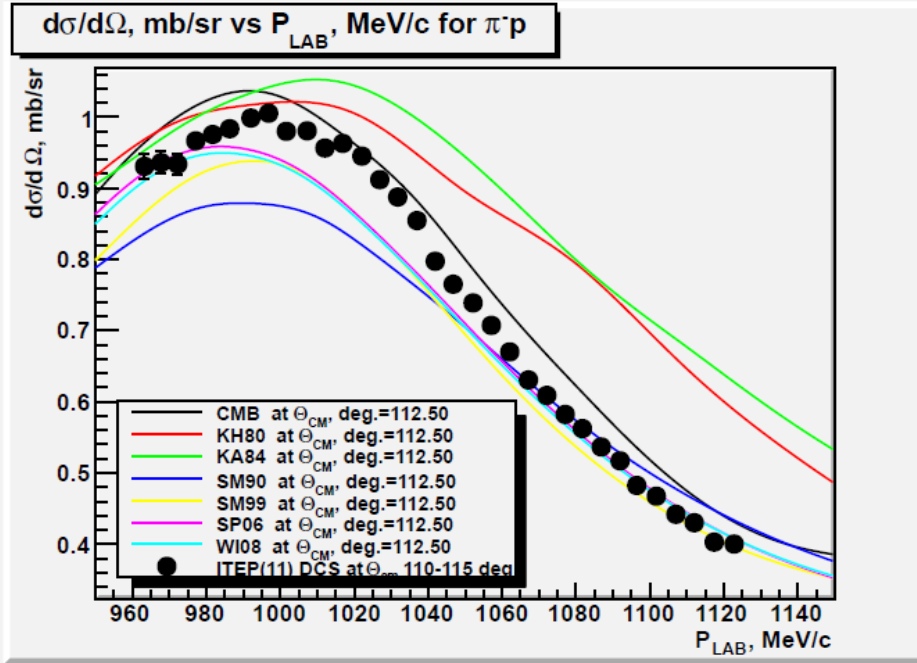

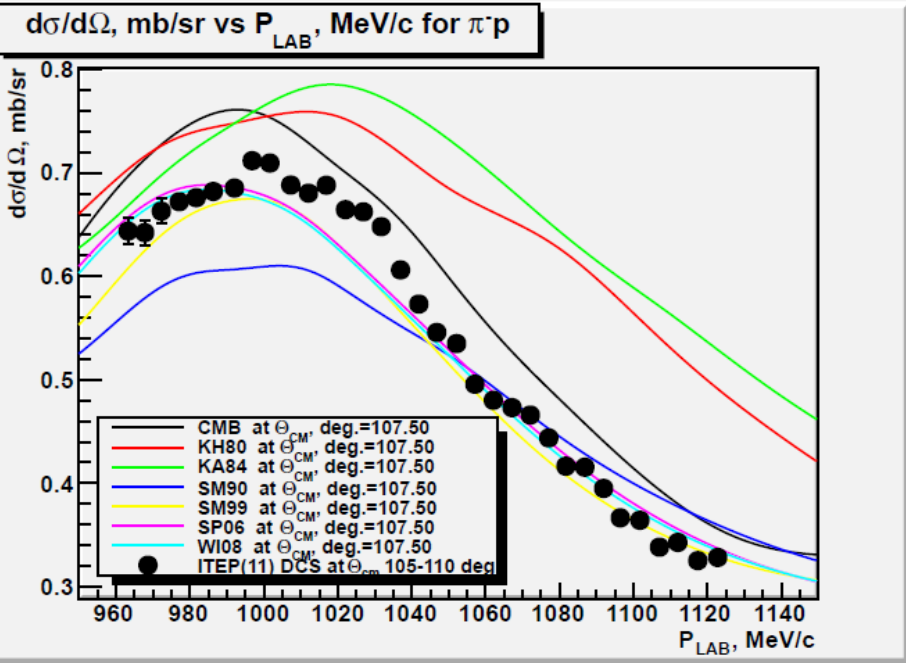

$d\sigma/d\Omega$ , mb/sr vs  $P_{LAB}$ , MeV/c for  $\pi^+\pi^-$

Statistical errors only

- ✓ We already collected nearly 3 billion triggers
- ✓ We see some narrow effect
- We need to:
  - Process the whole statistics
  - Do Monte-Carlo simulations
  - Find muon and electron contamination to the pion beam
  - Get more statistics

# Resonances and channel thresholds in the differential cross section

Resonance influence on the cross section

Any wave

$N(1685) - M_{\text{inv}} = 1685 \text{ МэВ} \rightarrow P_{\text{beam}} = 1024 \text{ MeV/c}$

Other channel threshold influence on the cross section

S-wave only

$\pi p \rightarrow K^0 \Sigma^0 - M_{\text{inv}} = 1690.2 \text{ MeV} \quad P_{\text{beam}} = 1033 \text{ MeV/c}$   
 $\pi p \rightarrow K^+ \Sigma^- - M_{\text{inv}} = 1691.1 \text{ MeV} \quad P_{\text{beam}} = 1035 \text{ MeV/c}$   
 $\pi p \rightarrow \omega n - M_{\text{inv}} = 1722.3 \text{ MeV} \quad P_{\text{beam}} = 1092 \text{ MeV/c}$

Most of the events have either all 4 particles going forward or 3 particles including the proton going forward and one pion going in some other direction

We keep the target and the beam equipment

The drift chambers we already have

New wide-aperture drift chambers

New hodoscopes
