**Undergraduate work involving Human Subjects Research**

Learning how to conduct ethical research with human subjects is a vital part of many students’ educational experience. Often undergraduate student projects do not meet the federal definition of human subjects research, and it is important that each student project be evaluated against the following criteria:

- **A human subject** is defined by federal regulations as “a living individual about whom an investigator conducting research obtains (1) data through intervention or interaction with the individual, or (2) identifiable private information.” (45 CFR 46.102(f)(1)(2))

- Federal Regulations define research as “a systematic investigation, including development, testing, and evaluation, designed to develop or contribute to generalizable knowledge”. (45 CFR 46.102(d))

Importantly, one’s ambition to publish the results of a project in a journal does not in and of itself make the project “research.”

**I. Undergraduate work that does not require IRB/HRPP oversight:**

Undergraduate projects that are designed with the objective of providing students with training about and experience with human subjects research do not require IRB review if all of the following conditions are met:

- The activity is designed for learning purposes only
- Results of the project are not presented outside of the classroom
- Data collection procedures present only minimal risk to the subjects
- Vulnerable populations (i.e. children, prisoners, cognitively impaired individuals) are not used
- Data is collected in a manner such that subjects are not identifiable

If the project meets these conditions, please provide The Letter of Introduction for Undergraduate Work Involving Human Subjects to all participants, which can be found on our Forms & Templates webpage.

**II. Undergraduate work that requires IRB/HRPP notification (but not a protocol):**

If the intent of the undergraduate project is to present the information at Brown (e.g. in a department, school, or symposium) and it meets the following conditions, then an Undergraduate
Project Involving Human Subjects form must be submitted to for HRPP’s review and records at IRB@Brown.edu.

- The project is designed for the purpose of the student’s educational experience/completing a thesis
- Data collection procedures present no more than minimal risk to the subjects
- Vulnerable populations (i.e. children, prisoners, cognitively impaired) are not used
- Data is collected in a manner such that the subjects are not identifiable or their confidentiality is protected

If the project meets these conditions, please provide The Letter of Introduction for Undergraduate Work Involving Human Subjects to all participants, which can be found on our Forms & Templates webpage.

III. Undergraduate work that requires a standard protocol submission:

Any undergraduate project involving human subjects that falls outside of the above conditions requires a standard IRB protocol submission found on our Forms & Templates webpage with the Faculty Advisor acting as the Principal Investigator.

IV. Responsibilities of Faculty Advisors:

- Faculty Advisors have the primary responsibility for ensuring that human subjects are treated ethically.
- Faculty Advisors must mentor their student researchers regarding ethical principles for the protection of human subjects, which includes completion of the CITI training course (required for all undergraduates whose work does not meet the criteria in Section I above).
- Faculty Advisors are responsible for reviewing and making the final determination regarding materials to be submitted to the IRB, including any survey instruments or interview questions.
- Faculty advisors should contact the HRPP (IRB@Brown.edu or (401) 863-3050) with any questions regarding undergraduate projects involving human subjects.

V. Definitions:

A. Research

- The Common Rule (45 CFR 46) defines research as a systematic investigation, including research development, testing and evaluation, designed to develop or contribute to generalized knowledge.
- Research involves the testing of concepts by the scientific method of formulating a hypothesis or research question, systematically collecting and recording relevant data, and interpreting the results in terms of the hypothesis or question.
- We define “generalizable knowledge” as conclusions, facts, or principles derived from particulars (e.g., individual subjects, medical records) that are applicable to or affect a whole category (members of a class, kind, or group, a field of knowledge, etc.) and enhance scientific or academic understanding. (Note that publication or other dissemination of findings does not in and of itself make the activity research under this definition.)

B. Human Subject/Participant
A human subject is a living individual about whom an investigator conducting research obtains data through intervention or interaction with the individual or through identifiable private information.

- **Intervention** includes both physical procedures by which data are gathered (e.g. venipuncture) and manipulations of the subject or the subject’s environment that are performed for research purposes.
- **Interaction** includes communication or interpersonal contact between investigator and subject.
- **Private information** includes information about behavior that occurs in a context in which an individual can reasonably expect that no observation or recording is taking place, and information that has been provided for specific purposes by an individual and that the individual can reasonably expect will not be made public (e.g. a medical record). Private information must be individually identifiable (i.e. the identity of the subject is or may readily by ascertained by the investigator or associated with the information) in order for obtaining the information to constitute research involving human subjects.

C. Vulnerable Populations

**Vulnerable populations** are groups of people considered likely to be vulnerable to coercion or undue influence. The regulations in 45 CFR 46 specify three groups of vulnerable populations and mandate special protections be in place to protect their rights and welfare. These populations include children/minors, pregnant women, human fetuses and neonates, and prisoners. There are other groups of people that the IRB may consider to be vulnerable, even though they are not specified as such in the regulations. Some examples of these vulnerable populations are students, employees, homeless persons, and persons unable to give consent.

If you have questions about whether a population you would like to include in your project would be considered vulnerable, contact the HRPP office for guidance.

D. Minimal Risk

**Minimal risk** means that the probability and magnitude of harm or discomfort anticipated in the research are not greater in and of themselves than those ordinarily encountered in daily life or during the performance of routine physical or psychological examinations or tests. Examples of minimal risk procedures include surveys, questionnaires and focus groups about non-sensitive topics or where data is collected without identifying information.
